## 1 Chapter

2 **1 Purpose and Definitions**3 **Parts**4 **1-1 TITLE, INTENT, SCOPE**5 **1-2 DEFINITIONS**

6

7 **1-1 TITLE, INTENT, SCOPE**8 ***Subparts***9 **1-101 Title**10 **1-102 Intent**11 **1-103 Scope**

12

13 ***Title* 1-101.10 Guam Food Code.**

14 These provisions shall be known as the Guam Food Code, hereinafter  
15 referred to as “this Code.”

16 ***Intent* 1-102.10 Food Safety, Illness Prevention, and Honest Presentation.**

17 The purpose of this Code is to safeguard public health and provide to  
18 CONSUMERS FOOD that is safe, UNADULTERATED, and honestly presented.

19 ***Scope* 1-103.10 Statement.**

20 This Code establishes definitions; sets standards for management and  
21 personnel, FOOD operations, and EQUIPMENT and facilities; and provides for  
22 FOOD ESTABLISHMENT plan review, PERMIT issuance, inspection, EMPLOYEE  
23 RESTRICTION, and PERMIT suspension.

24

25 **1-2 DEFINITIONS**26 ***Subpart***27 **1-201 Applicability and Terms Defined**

1 **Applicability** 1-201.10 **Statement of Application and Listing of Terms.**

2 **and Terms**

3 **Defined**

4 (A) The following definitions shall apply in the interpretation and application of  
5 this Code.

6 (B) Terms Defined. As used in this Code, each of the terms listed in  
7 ¶ 1-201.10(B) shall have the meaning stated below.

8 **Accredited Program.**

9 (1) **“Accredited program”** means a food protection manager certification  
10 program that has been evaluated and listed by a REGULATORY AUTHORITY.

11 (2) **“Accredited program”** does not refer to training functions or educational  
12 programs.

13 **Additive.**

14 (1) **“Food additive”** has the meaning stated in the Federal Food, Drug, and  
15 Cosmetic Act, § 201(s) and 21 CFR 170.3(e)(1).

16 (2) **“Color additive”** has the meaning stated in the Federal Food, Drug, and  
17 Cosmetic Act, § 201(t) and 21 CFR 70.3(f).

18 **“Adulterated”** has the meaning stated in the Federal Food, Drug, and Cosmetic  
19 Act, § 402.

20 **“Approved”** means acceptable to the REGULATORY AUTHORITY based on a  
21 determination of conformity with principles, practices, and generally recognized  
22 standards that protect public health.

23 **Asymptomatic.**

24 (1) **“Asymptomatic”** means without obvious symptoms; not showing or  
25 producing indications of a disease or other medical condition, such as an  
26 individual infected with a pathogen but not exhibiting or producing any signs  
27 or symptoms of vomiting, diarrhea, or jaundice.

28 (2) **“Asymptomatic”** includes not showing symptoms because symptoms have  
29 resolved or subsided, or because symptoms never manifested.

1       “**a<sub>w</sub>**” means water activity which is a measure of the free moisture in a FOOD, is the  
2       quotient of the water vapor pressure of the substance divided by the vapor pressure  
3       of pure water at the same temperature, and is indicated by the symbol  $A_w$ .

4       “**Balut**” means an embryo inside a fertile EGG that has been incubated for a period  
5       sufficient for the embryo to reach a specific stage of development after which it is  
6       removed from incubation before hatching.

7       “**Beverage**” means a liquid for drinking, including water.

8       “**Bottled drinking water**” means water that is SEALED in bottles, packages, or other  
9       containers and offered for sale for human consumption, including bottled mineral  
10      water.

11      “**Casing**” means a tubular container for sausage products made of either  
12      natural or artificial (synthetic) material.

13      “**Certification number**” means a unique combination of letters and numbers  
14      assigned by a SHELLFISH CONTROL AUTHORITY to a MOLLUSCAN SHELLFISH DEALER  
15      according to the provisions of the National Shellfish Sanitation Program.

16      “**CFR**” means CODE OF FEDERAL REGULATIONS. Citations in this Code to the CFR  
17      refer sequentially to the Title, Part, and Section numbers, such as 40 CFR 180.194  
18      refers to Title 40, Part 180, Section 194.

19      **CIP.**

20      (1)   “**CIP**” means cleaned in place by the circulation or flowing by mechanical  
21      means through a piping system of a detergent solution, water rinse, and  
22      SANITIZING solution onto or over EQUIPMENT surfaces that require cleaning,  
23      such as the method used, in part, to clean and SANITIZE a frozen dessert  
24      machine.

25      (2)   “**CIP**” does not include the cleaning of EQUIPMENT such as band saws,  
26      slicers, or mixers that are subjected to in-place manual cleaning without the  
27      use of a CIP system.

28      “**Commingle**” means:

29      (1)   To combine SHELLSTOCK harvested on different days or from different  
30      growing areas as identified on the tag or label, or

1 (2) To combine SHUCKED SHELLFISH from containers with different container  
2 codes or different shucking dates.

3 **Comminuted.**

4 (1) **“Comminuted”** means reduced in size by methods including chopping,  
5 flaking, grinding, or mincing.

6 (2) **“Comminuted”** includes FISH or MEAT products that are reduced in size and  
7 restructured or reformulated such as gefilte FISH, gyros, ground beef, and  
8 sausage; and a mixture of 2 or more types of MEAT that have been reduced in  
9 size and combined, such as sausages made from 2 or more MEATS.

10 **“Conditional employee”** means a potential FOOD EMPLOYEE to whom a job offer is  
11 made, conditional on responses to subsequent medical questions or examinations  
12 designed to identify potential FOOD EMPLOYEES who may be suffering from a disease  
13 that can be transmitted through FOOD and done in compliance with Title 1 of the  
14 Americans with Disabilities Act of 1990.

15 **“Confirmed disease outbreak”** means a FOODBORNE DISEASE OUTBREAK in which  
16 laboratory analysis of appropriate specimens identifies a causative agent or  
17 epidemiological analysis implicates a FOOD as the source of the illness.

18 **“Consumer”** means a PERSON who is a member of the public, takes possession of  
19 FOOD, is not functioning in the capacity of an operator of a  
20 FOOD ESTABLISHMENT OR FOOD PROCESSING PLANT, and does not offer the  
21 FOOD for resale.

22 **“Corrosion-resistant material”** means a material that maintains acceptable  
23 surface cleanability characteristics under prolonged influence of the FOOD to be  
24 contacted, the normal use of cleaning compounds and SANITIZING solutions, and  
25 other conditions of the use environment.

26 **“Counter-mounted equipment”** means EQUIPMENT that is not portable and is  
27 designed to be mounted off the floor on a table, counter, or shelf.

28 **“Critical control point”** means a point or procedure in a specific FOOD system  
29 where loss of control may result in an unacceptable health RISK.

1       **Critical Item.**

2       (1)     **“Critical item”** means a provision of this Code, that, if in noncompliance, is  
3             more likely than other violations to contribute to FOOD contamination, illness,  
4             or environmental health HAZARD.

5       (2)     **“Critical item”** is an item that is denoted in this Code with an asterisk \*.

6       **“Critical limit”** means the maximum or minimum value to which a physical,  
7       biological, or chemical parameter must be controlled at a CRITICAL CONTROL POINT to  
8       minimize the RISK that the identified FOOD safety HAZARD may occur.

9       **“Dealer”** means a PERSON who is authorized by a SHELLFISH CONTROL AUTHORITY for  
10       the activities of SHELLSTOCK shipper, shucker-packer, repacker, reshipper, or  
11       depuration processor of MOLLUSCAN SHELLFISH according to the provisions of the  
12       National Shellfish Sanitation Program.

13       **“Disclosure”** means a written statement that clearly identifies the animal-derived  
14       FOODS which are, or can be ordered, raw, undercooked, or without otherwise being  
15       processed to eliminate pathogens, or items that contain an ingredient that is raw,  
16       undercooked, or without otherwise being processed to eliminate pathogens.

17       **Drinking Water.**

18       (1)     **“Drinking water”** means water that meets criteria as specified in 40CFR  
19             141 National Primary Drinking Water Regulations.

20       (2)     **“Drinking water”** is traditionally known as “potable water.”

21       (3)     **“Drinking water”** includes the term “water” *except where the term used*  
22             *connotes that the water is not potable, such as “boiler water,” “mop water,”*  
23             *“rainwater,” “wastewater,” and “nondrinking” water.*

24       **“Dry storage area”** means a room or area designated for the storage of PACKAGED  
25       or containerized bulk FOOD that is not POTENTIALLY HAZARDOUS (TIME/TEMPERATURE  
26       CONTROL FOR SAFETY FOOD) and dry goods such as SINGLE-SERVICE items.

**Easily Cleanable.**

- (1) **“Easily cleanable”** means a characteristic of a surface that:
- (a) Allows effective removal of soil by normal cleaning methods;
  - (b) Is dependent on the material, design, construction, and installation of the surface; and
  - (c) Varies with the likelihood of the surface's role in introducing pathogenic or toxigenic agents or other contaminants into FOOD based on the surface's APPROVED placement, purpose, and use.
- (2) **“Easily cleanable”** includes a tiered application of the criteria that qualify the surface as EASILY CLEANABLE as specified in Subparagraph (1) of this definition to different situations in which varying degrees of cleanability are required such as:
- (a) The appropriateness of stainless steel for a FOOD preparation surface as opposed to the lack of need for stainless steel to be used for floors or for tables used for CONSUMER dining; or
  - (b) The need for a different degree of cleanability for a utilitarian attachment or accessory in the kitchen as opposed to a decorative attachment or accessory in the CONSUMER dining area.

**“Easily movable”** means:

- (1) Portable; mounted on casters, gliders, or rollers; or provided with a mechanical means to safely tilt a unit of EQUIPMENT for cleaning; and
- (2) Having no utility connection, a utility connection that disconnects quickly, or a flexible utility connection line of sufficient length to allow the EQUIPMENT to be moved for cleaning of the EQUIPMENT and adjacent area.

**Egg.**

- (1) **“Egg”** means the shell EGG of avian species such as chicken, duck, goose, guinea, quail, RATITES or turkey.
- (2) **“Egg”** does not include:
  - (a) A BALUT;
  - (b) The egg of reptile species such as alligator; or

1 (c) *An EGG PRODUCT.*

2 **Egg Product.**

3 (1) **“Egg Product”** means all, or a portion of, the contents found inside EGGS  
4 separated from the shell and pasteurized in a FOOD PROCESSING PLANT, with  
5 or without added ingredients, intended for human consumption, such as  
6 dried, frozen or liquid eggs.

7 (2) **“Egg Product”** does not include *FOOD which contains EGGS only in a*  
8 *relatively small proportion such as cake mixes.*

9 **“Employee”** means the PERMIT HOLDER, PERSON IN CHARGE, FOOD EMPLOYEE,  
10 PERSON having supervisory or management duties, PERSON on the payroll, family  
11 member, volunteer, PERSON performing work under contractual agreement, or other  
12 PERSON working in a FOOD ESTABLISHMENT.

13 **“Enterohemorrhagic *Escherichia coli*”** (EHEC) means *E. coli* which cause  
14 hemorrhagic colitis, meaning bleeding enterically or bleeding from the intestine.  
15 The term is typically used in association with *E. coli* that have the capacity to  
16 produce Shiga toxins and to cause attaching and effacing lesions in the intestine.  
17 EHEC is a subset of STEC, whose members produce additional virulence factors.  
18 Infections with EHEC may be asymptomatic but are classically associated with  
19 bloody diarrhea (hemorrhagic colitis) and hemolytic uremic syndrome (HUS) or  
20 thrombotic thrombocytopenic purpura (TTP). Examples of serotypes of EHEC  
21 include: *E. coli*O157:H7; *E. coli* O157:NM; *E. coli* O26:H11; *E. coli* O145:NM; *E.*  
22 *coli* O103:H2; or *E. coli* O111:NM. Also see SHIGA TOXIN-PRODUCING *E. coli*.

23 **“EPA”** means the U.S. Environmental Protection Agency.

24 **Equipment.**

25 (1) **“Equipment”** means an article that is used in the operation of a FOOD  
26 ESTABLISHMENT such as a freezer, grinder, hood, ice maker, MEAT block,  
27 mixer, oven, reach-in refrigerator, scale, sink, slicer, stove, table,  
28 TEMPERATURE MEASURING DEVICE for ambient air, VENDING MACHINE, or  
29 WAREWASHING machine.

30 (2) **“Equipment”** does not include *apparatuses used for handling or storing*

1 *large quantities of PACKAGED FOODS that are received from a supplier in a*  
2 *cased or overwrapped lot, such as hand trucks, forklifts, dollies, pallets,*  
3 *racks, and skids.*

4 **“Exclude”** means to prevent a PERSON from working as an EMPLOYEE in a FOOD  
5 ESTABLISHMENT or entering a FOOD ESTABLISHMENT as an EMPLOYEE.

6 **“FDA”** means the U.S. Food and Drug Administration.

7 **Fish.**

8 (1) **“Fish”** means fresh or saltwater finfish, crustaceans and other forms of  
9 aquatic life (including alligator, frog, aquatic turtle, jellyfish, sea cucumber,  
10 and sea urchin and the roe of such animals) other than birds or mammals,  
11 and all mollusks, if such animal life is intended for human consumption.

12 (2) **“Fish”** includes an edible human FOOD product derived in whole or in  
13 part from FISH, including FISH that have been processed in any manner.

14 **“Food”** means a raw, cooked, or processed edible substance, ice, BEVERAGE, or  
15 ingredient used or intended for use or for sale in whole or in part for human  
16 consumption, or chewing gum.

17 **“Foodborne disease outbreak”** means the occurrence of two or more cases of a  
18 similar illness resulting from the ingestion of a common FOOD.

19 **“Food-contact surface”** means:

20 (1) A surface of EQUIPMENT or a UTENSIL with which FOOD normally comes into  
21 contact; or

22 (2) A surface of EQUIPMENT or a UTENSIL from which FOOD may drain, drip,  
23 or splash:

24 (a) Into a FOOD, or

25 (b) Onto a surface normally in contact with FOOD.

26 **“Food employee”** means an individual working at FOOD ESTABLISHMENTS with  
27 PACKAGED, UNPACKAGED FOOD, FOOD EQUIPMENT or UTENSILS, or FOOD-CONTACT  
28 SURFACES.

29 **Food Establishment.**

30 (1) **“Food establishment”** means an operation that stores, prepares,

1 packages, serves, vends food directly to the consumer, or otherwise  
2 provides FOOD for human consumption:

- 3 (a) Such as a restaurant; satellite or catered feeding location; catering  
4 operation if the operation provides FOOD directly to a CONSUMER or to a  
5 conveyance used to transport people; market; vending location;  
6 conveyance used to transport people; institution; or FOOD bank; and  
7 (b) That relinquishes possession of FOOD to a CONSUMER directly, or  
8 indirectly through a delivery service such as home delivery of grocery  
9 orders or restaurant takeout orders, or delivery service that is  
10 provided by common carriers.

11 (2) **“Food establishment”** includes:

- 12 (a) An element of the operation such as a transportation vehicle or a  
13 central preparation facility that supplies a vending location or satellite  
14 feeding location *unless the vending or feeding location is permitted by*  
15 *the* REGULATORY AUTHORITY; and  
16 (b) An operation that is conducted in a mobile, stationary, temporary, or  
17 permanent facility or location; where consumption is on or off the  
18 PREMISES; and regardless of whether there is a charge for the FOOD.

19 (3) **“Food establishment” does not include:**

- 20 (a) *A produce stand that only offers whole, uncut fresh fruits and vegetables;*  
21 (b) *A FOOD PROCESSING PLANT; including those that are located on the*  
22 *PREMISES of a FOOD ESTABLISHMENT;*  
23 (c) *A kitchen in a private home if only FOOD that is not POTENTIALLY*  
24 *HAZARDOUS (TIME/TEMPERATURE CONTROL FOR SAFETY) FOOD, is prepared*  
25 *for sale or service at a function such as a religious or charitable*  
26 *organization's bake sale if allowed by LAW and if the CONSUMER is*  
27 *informed by a clearly visible placard at the sales or service location*  
28 *that the FOOD is prepared in a kitchen that is not subject to regulation*  
29 *and inspection by the REGULATORY AUTHORITY;*  
30 (d) *An area where FOOD that is prepared as specified in Subparagraph*

1                   (3)(c) of this definition is sold or offered for human consumption;

2                   (e)    A kitchen in a private home, such as a small family day-care provider;  
3                   or a bed-and-breakfast operation that prepares and offers FOOD to  
4                   guests if the home is owner occupied, the number of available guest  
5                   bedrooms does not exceed 6, breakfast is the only meal offered, the  
6                   number of guests served does not exceed 18, and THE CONSUMER IS  
7                   informed by statements contained in published advertisements,  
8                   mailed brochures, and placards posted at the registration area that  
9                   the FOOD is prepared in a kitchen that is not regulated and inspected  
10                  by the REGULATORY AUTHORITY; or

11                  (f)    A private home that receives catered or home-delivered FOOD.

12                  **“Food processing plant”** means a commercial operation that manufactures,  
13                  packages, labels, or stores FOOD for human consumption, and provides FOOD for  
14                  sale or distribution to other business entities such as FOOD PROCESSING PLANTS OR  
15                  FOOD ESTABLISHMENTS.

16                  **Game Animal.**

17                  (1)    **“Game animal”** means an animal, the products of which are FOOD, that is  
18                  not classified as livestock, sheep, swine, goat, horse, mule, or other equine  
19                  in 9 CFR 301.2 Definitions, or as Poultry, or FISH.

20                  (2)    **“Game animal”** includes mammals such as reindeer, elk, deer, antelope,  
21                  water buffalo, bison, rabbit, squirrel, opossum, raccoon, nutria, or muskrat,  
22                  and nonaquatic reptiles such as land snakes.

23                  (3)    **“Game animal”** does not include RATITES.

24                  **“General use pesticide”** means a pesticide that is not classified by EPA for  
25                  restricted use as specified in 40 CFR 152.175. Pesticides classified for restricted  
26                  use.

27                  **“Grade A standards”** means the requirements of the United States Public Health  
28                  Service/FDA “Grade A Pasteurized Milk Ordinance” with which certain fluid and dry  
29                  milk and milk products comply.

30                  **“HACCP plan”** means a written document that delineates the formal procedures for

1 following the HAZARD Analysis and CRITICAL CONTROL POINT principles developed by  
2 The National Advisory Committee on Microbiological Criteria for Foods.

### 3 **Handwashing Sink.**

4 (1) **“Handwashing sink”** means a lavatory, a basin or vessel for washing, a  
5 wash basin, or a PLUMBING FIXTURE especially placed for use in personal  
6 hygiene and designed for the washing of the hands.

7 (2) **“Handwashing sink”** includes an automatic handwashing facility.

8 **“Hazard”** means a biological, chemical, or physical property that may cause an  
9 unacceptable CONSUMER health RISK.

10 **“Health practitioner”** means a physician licensed to practice medicine, or if  
11 allowed by LAW, a nurse practitioner, physician assistant, or similar medical  
12 professional.

13 **“Hermetically sealed container”** means a container that is designed and intended  
14 to be secure against the entry of microorganisms and, in the case of low acid  
15 canned FOODS, to maintain the commercial sterility of its contents after processing.

16 **“Highly susceptible population”** means PERSONS who are more likely than other  
17 people in the general population to experience foodborne disease because they  
18 are:

19 (1) Immunocompromised; preschool age children, or older adults; and

20 (2) Obtaining FOOD at a facility that provides services such as custodial care,  
21 health care, or assisted living, such as a child or adult day care center,  
22 kidney dialysis center, hospital or nursing home, or nutritional or  
23 socialization services such as a senior center.

24 **“Imminent health hazard”** means a significant threat or danger to health that is  
25 considered to exist when there is evidence sufficient to show that a product,  
26 practice, circumstance, or event creates a situation that requires immediate  
27 correction or cessation of operation to prevent injury based on:

28 (1) The number of potential injuries, and

29 (2) The nature, severity, and duration of the anticipated injury.

30 **“Injected”** means manipulating a MEAT so that infectious or toxigenic

1 microorganisms may be introduced from its surface to its interior through  
2 tenderizing with deep penetration or injecting the MEAT such as by processes which  
3 may be referred to as “injecting,” “pinning,” or “stitch pumping.”

4 **Juice.**

5 (1) **“Juice”** means the aqueous liquid expressed or extracted from one  
6 or more fruits or vegetables, purées of the edible portions of one or  
7 more fruits or vegetables, or any concentrates of such liquid or purée.

8 (2) **“Juice”** does not include, for purposes of HACCP, liquids, purées, or  
9 concentrates that are not used as BEVERAGES or ingredients of  
10 BEVERAGES.

11 **“Kitchenware”** means FOOD preparation and storage UTENSILS.

12 **“Law”** means applicable local, state, and federal statutes, regulations, and  
13 ordinances.

14 **“Linens”** means fabric items such as cloth hampers, cloth napkins, table cloths,  
15 wiping cloths, and work garments including cloth gloves.

16 **Major Food Allergen.**

17 (1) **“Major food allergen”** means:

18 (a) Milk, EGG, fish (such as bass, flounder, cod, and including crustacean  
19 shellfish such as crab, lobster, or shrimp), tree nuts (such as  
20 almonds, pecans, or walnuts), wheat, peanuts, and soybeans; or

21 (b) A FOOD ingredient that contains protein derived from a FOOD, as  
22 specified in Subparagraph (1)(a) of this definition.

23 (2) **“Major food allergen”** does not include:

24 (a) Any highly refined oil derived from a FOOD specified in Subparagraph  
25 (1)(a) of this definition and any ingredient derived from such highly  
26 refined oil; or

27 (b) Any ingredient that is exempt under the petition or notification process  
28 specified in the Food Allergen Labeling and Consumer Protection Act  
29 of 2004 (Public Law 108-282).

30 **“Meat”** means the flesh of animals used as FOOD including the dressed flesh of

1 cattle, swine, sheep, or goats and other edible animals, *except FISH, POULTRY, and*  
2 *wild GAME ANIMALS as specified under Subparagraphs 3-201.17(A)(3) and (4).*

3 **“mg/L”** means milligrams per liter, which is the metric equivalent of parts per million  
4 (ppm).

5 **“Molluscan shellfish”** means any edible species of fresh or frozen oysters, clams,  
6 mussels, and scallops or edible portions thereof, *except when the scallop product*  
7 *consists only of the shucked adductor muscle.*

#### 8 **Packaged.**

9 (1) **“Packaged”** means bottled, canned, cartoned, securely bagged, or securely  
10 wrapped, whether PACKAGED in a FOOD ESTABLISHMENT or a FOOD PROCESSING  
11 PLANT.

12 (2) **“Packaged”** *does not include a wrapper, carry-out box, or other nondurable*  
13 *container used to containerize FOOD with the purpose of facilitating FOOD*  
14 *protection during service and receipt of the FOOD by the CONSUMER.*

15 **“Permit”** means the document issued by the REGULATORY AUTHORITY that authorizes  
16 a PERSON to operate a FOOD ESTABLISHMENT.

17 **“Permit holder”** means the entity that:

- 18 (1) Is legally responsible for the operation of the FOOD ESTABLISHMENT such as  
19 the owner, the owner's agent, or other PERSON; and  
20 (2) Possesses a valid PERMIT to operate a FOOD ESTABLISHMENT.

21 **“Person”** means an association, a corporation, individual, partnership, other legal  
22 entity, government, or governmental subdivision or agency.

23 **“Person in charge”** means the individual present at a FOOD ESTABLISHMENT who is  
24 responsible for the operation at the time of inspection.

#### 25 **Personal Care Items.**

26 (1) **“Personal care items”** means items or substances that may be poisonous,  
27 toxic, or a source of contamination and are used to maintain or enhance a  
28 PERSON'S health, hygiene, or appearance.

1 (2) **“Personal care items”** include items such as medicines; first aid supplies;  
2 and other items such as cosmetics, and toiletries such as toothpaste and  
3 mouthwash.

4 **“pH”** means the symbol for the negative logarithm of the hydrogen ion  
5 concentration, which is a measure of the degree of acidity or alkalinity of a  
6 solution.

7 Values between 0 and 7 indicate acidity and values between 7 and 14 indicate  
8 alkalinity. The value for pure distilled water is 7, which is considered neutral.

9 **“Physical facilities”** means the structure and interior surfaces of a FOOD  
10 ESTABLISHMENT including accessories such as soap and towel dispensers and  
11 attachments such as light fixtures and heating or air conditioning system vents.

12 **“Plumbing fixture”** means a receptacle or device that:

- 13 (1) Is permanently or temporarily connected to the water distribution system of  
14 the PREMISES and demands a supply of water from the system; or  
15 (2) Discharges used water, waste materials, or SEWAGE directly or indirectly to  
16 the drainage system of the PREMISES.

17 **“Plumbing system”** means the water supply and distribution pipes; PLUMBING  
18 FIXTURES and traps; soil, waste, and vent pipes; sanitary and storm sewers and  
19 building drains, including their respective connections, devices, and appurtenances  
20 within the PREMISES; and water-treating EQUIPMENT.

21 **“Poisonous or toxic materials”** means substances that are not intended for  
22 ingestion and are included in 4 categories:

- 23 (1) Cleaners and SANITIZERS, which include cleaning and SANITIZING agents and  
24 agents such as caustics, acids, drying agents, polishes, and other  
25 chemicals;  
26 (2) Pesticides, *except* SANITIZERS, which include substances such as insecticides  
27 and rodenticides;  
28 (3) Substances necessary for the operation and maintenance of the  
29 establishment such as nonfood grade lubricants and PERSONAL CARE ITEMS  
30 that may be deleterious to health; and

- 1 (4) Substances that are not necessary for the operation and maintenance of the  
2 establishment and are on the PREMISES for retail sale, such as petroleum  
3 products and paints.

4 **Potentially Hazardous Food (Time/Temperature Control for Safety Food).**

- 5 (1) **“Potentially hazardous food (time/temperature control for safety food)”**  
6 means a FOOD that requires time/temperature control for safety (TCS) to limit  
7 pathogenic microorganism growth or toxin formation.

- 8 (2) **“Potentially hazardous food (time/temperature control for safety food)”**  
9 includes:

- 10 (a) An animal FOOD that is raw or heat-treated; a plant FOOD that is heat-  
11 treated or consists of raw seed sprouts, cut melons, cut tomatoes or  
12 mixtures of cut tomatoes that are not modified in a way so that they  
13 are unable to support pathogenic microorganism growth or toxin  
14 formation, or garlic-in-oil mixtures that are not modified in a way that  
15 results in mixtures that do not support pathogenic microorganism  
16 growth or toxin formation; and  
17 (b) Except as specified in Subparagraph (3)(d) of this definition, a FOOD  
18 that because of the interaction of its  $A_w$  and PH values is designated  
19 as Product Assessment Required (PA) in Table A or B of this  
20 definition:

21 **Table A. Interaction of pH and  $A_w$  for control of spores in FOOD heat-treated to**  
22 **destroy vegetative cells and subsequently PACKAGED**

$A_w$ values	<u>PH values</u>		
	4.6 or less	> 4.6 - 5.6	> 5.6
$\leq 0.92$	non-PHF*/non- TCS FOOD**	non-PHF/non- TCS FOOD	non-PHF/non- TCS FOOD
> 0.92 - .95	non-PHF/non- TCS FOOD	non-PHF/non- TCS FOOD	PA***
> 0.95	non-PHF/non-	PA	PA

## TCS FOOD

\* PHF means POTENTIALLY HAZARDOUS FOOD

\*\* TCS FOOD means TIME/TEMPERATURE CONTROL FOR SAFETY FOOD

\*\*\* PA means Product Assessment required

**Table B. Interaction of pH and  $A_w$  for control of vegetative cells and spores in FOOD not heat-treated or heat-treated but not PACKAGED**

$A_w$ values	pH values			
	< 4.2	4.2 - 4.6	> 4.6 - 5.0	> 5.0
< 0.88	non-PHF*/non-TCS food**	non-PHF/non-TCS food	non-PHF/non-TCS food	non-PHF/non-TCS food
0.88 – 0.90	non-PHF/non-TCS food	non-PHF/non-TCS food	non-PHF/non-TCS food	PA***
> 0.90 – 0.92	non-PHF/non-TCS food	non-PHF/non-TCS food	PA	PA
> 0.92	on-PHF/non-TCS food	PA	PA	PA

\* PHF means POTENTIALLY HAZARDOUS FOOD

\*\* TCS FOOD means TIME/TEMPERATURE CONTROL FOR SAFETY FOOD

\*\*\* PA means Product Assessment required

(3) ***“Potentially hazardous food (time/temperature control for safety food)”***

*does not include:*

(a) *An air-cooled hard-boiled EGG with shell intact, or an EGG with shell intact that is not hard-boiled, but has been pasteurized to destroy all viable **salmonellae**;*

(b) *A FOOD in an unopened HERMETICALLY SEALED CONTAINER that is commercially processed to achieve and maintain commercial sterility under conditions of non-refrigerated storage and distribution;*

- 1 (c) *A FOOD that because of its PH or  $A_w$  value, or interaction of  $A_w$  and PH*  
2 *values, is designated as a non-PHF/non-TCS FOOD in Table A or B of*  
3 *this definition;*
- 4 (d) *A FOOD that is designated as Product Assessment Required (PA) in*  
5 *Table A or B of this definition and has undergone a Product*  
6 *Assessment showing that the growth or toxin formation of pathogenic*  
7 *microorganisms that are reasonably likely to occur in that FOOD is*  
8 *precluded due to:*
- 9 (i) *Intrinsic factors including added or natural characteristics of the*  
10 *FOOD such as preservatives, antimicrobials, humectants,*  
11 *acidulants, or nutrients,*
- 12 (ii) *Extrinsic factors including environmental or operational factors*  
13 *that affect the FOOD such as packaging, modified atmosphere*  
14 *such as REDUCED OXYGEN PACKAGING, shelf life and use, or*  
15 *temperature range of storage and use, or*
- 16 (iii) *A combination of intrinsic and extrinsic factors; or*
- 17 (e) *A FOOD that does not support the growth or toxin formation of*  
18 *pathogenic microorganisms in accordance with one of the*  
19 *Subparagraphs (3)(a) - (3)(d) of this definition even though the FOOD*  
20 *may contain a pathogenic microorganism or chemical or physical*  
21 *contaminant at a level sufficient to cause illness or injury.*

22 **“Poultry”** means:

- 23 (1) Any domesticated bird (chickens, turkeys, ducks, geese, guineas, RATITES, or  
24 squabs), whether live or dead, as defined in 9 CFR 381.1 Poultry Products  
25 Inspection Regulations Definitions, Poultry; and
- 26 (2) Any migratory waterfowl or game bird, pheasant, partridge, quail, grouse, or  
27 pigeon, whether live or dead, as defined in 9 CFR 362.1 Voluntary Poultry  
28 Inspection Regulations, Definitions.

29 **“Premises”** means:

- 30 (1) The PHYSICAL FACILITY, its contents, and the contiguous land or property

1 under the control of the PERMIT HOLDER; or

- 2 (2) The PHYSICAL FACILITY, its contents, and the land or property not described in  
3 Subparagraph (1) of this definition if its facilities and contents are under the  
4 control of the PERMIT HOLDER and may impact FOOD ESTABLISHMENT personnel,  
5 facilities, or operations, and a FOOD ESTABLISHMENT is only one component of  
6 a larger operation such as a health care facility, hotel, motel, school,  
7 recreational camp, or prison.

8 **“Primal cut”** means a basic major cut into which carcasses and sides of MEAT are  
9 separated, such as a beef round, pork loin, lamb flank, or veal breast.

10 **“Public water system”** has the meaning stated in 40 CFR 141 National Primary  
11 Drinking Water Regulations.

12 **“Ratite”** means a flightless bird such as an emu, ostrich, or rhea.

13 **Ready-to-Eat Food.**

- 14 (1) **“Ready-to-eat food”** means FOOD that:

- 15 (a) Is in a form that is edible without additional preparation to achieve  
16 FOOD safety, as specified under one of the following: ¶ 3-401.11(A) or  
17 (B), § 3-401.12, or § 3-402.11, or as specified in ¶ 3-401.11(C); or  
18 (b) Is a raw or partially cooked animal FOOD and the consumer is advised  
19 as specified in Subparagraphs 3-401.11(D)(1) and (2); or  
20 (c) Is prepared in accordance with a variance that is granted as specified  
21 in Subparagraphs 3-401.11(D) and (3); and  
22 (d) May receive additional preparation for palatability or aesthetic,  
23 epicurean, gastronomic, or culinary purposes.

- 24 (2) **“Ready-to-eat food”** includes:

- 25 (a) Raw animal FOOD that is cooked as specified under § 3-401.11 or  
26 3-401.12, or frozen as specified under § 3-402.11;  
27 (b) Raw fruits and vegetables that are washed as specified under §  
28 3-302.15;  
29 (c) Fruits and vegetables that are cooked for hot holding, as specified  
30 under § 3-401.13;

- 1 (d) All POTENTIALLY HAZARDOUS FOOD (TIME/TEMPERATURE CONTROL FOR  
2 SAFETY FOOD) that is cooked to the temperature and time required for  
3 the specific FOOD under Subpart 3-401 and cooled as specified under  
4 § 3-501.14;
- 5 (e) Plant FOOD for which further washing, cooking, or other processing is  
6 not required for FOOD safety, and from which rinds, peels, husks, or  
7 shells, if naturally present are removed;
- 8 (f) Substances derived from plants such as spices, seasonings, and  
9 sugar;
- 10 (g) A bakery item such as bread, cakes, pies, fillings, or icing for which  
11 further cooking is not required for FOOD safety;
- 12 (h) The following products that are produced in accordance with USDA  
13 guidelines and that have received a lethality treatment for pathogens:  
14 dry, fermented sausages, such as dry salami or pepperoni; salt-cured  
15 MEAT and POULTRY products, such as prosciutto ham, country cured  
16 ham, and Parma ham; and dried MEAT and POULTRY products, such as  
17 jerky or beef sticks; and
- 18 (i) FOODS manufactured as specified in 21 CFR Part 113, Thermally  
19 Processed Low-Acid Foods Packaged in Hermetically Sealed  
20 Containers.

21 **Reduced Oxygen Packaging.**

- 22 (1) **“Reduced oxygen packaging”** means:
- 23 (a) The reduction of the amount of oxygen in a PACKAGE by removing  
24 oxygen; displacing oxygen and replacing it with another gas or  
25 combination of gases; or otherwise controlling the oxygen content to a  
26 level below that normally found in the atmosphere (approximately  
27 21% at sea level); and

1 (b) A process as specified in Subparagraph (1)(a) of this definition that  
2 involves a FOOD for which the HAZARDS *Clostridium botulinum* or  
3 *Listeria monocytogenes* require control in the final PACKAGED form.

4 (2) **“Reduced oxygen packaging”** includes:

5 (a) Vacuum PACKAGING, in which air is removed from a PACKAGE of FOOD  
6 and the PACKAGE is HERMETICALLY SEALED so that a vacuum remains  
7 inside the PACKAGE;

8 (b) Modified atmosphere PACKAGING, in which the atmosphere of a  
9 PACKAGE of FOOD is modified so that its composition is different from  
10 air but the atmosphere may change over time due to the permeability  
11 of the PACKAGING material or the respiration of the FOOD. Modified  
12 atmosphere PACKAGING includes reduction in the proportion of oxygen,  
13 total replacement of oxygen, or an increase in the proportion of other  
14 gases such as carbon dioxide or nitrogen;

15 (c) Controlled atmosphere PACKAGING, in which the atmosphere of a  
16 PACKAGE of FOOD is modified so that until the PACKAGE is opened, its  
17 composition is different from air, and continuous control of that  
18 atmosphere is maintained, such as by using oxygen scavengers or a  
19 combination of total replacement of oxygen, nonrespiring FOOD, and  
20 impermeable PACKAGING material;

21 (d) Cook chill PACKAGING, in which cooked FOOD is hot filled into  
22 impermeable bags which have the air expelled and are then sealed or  
23 crimped closed. The bagged FOOD is rapidly chilled and refrigerated  
24 at temperatures that inhibit the growth of psychotropic pathogens; or  
25 (e) Sous vide PACKAGING, in which raw or partially cooked FOOD is placed  
26 in a hermetically sealed, impermeable bag, cooked in the bag, rapidly  
27 chilled, and refrigerated at temperatures that inhibit the growth of  
28 psychotropic pathogens.

29 **“Refuse”** means solid waste not carried by water through the SEWAGE system.

1       **“Regulatory authority”** means the Department of Public Health and Social  
2 Services and its authorized representatives having jurisdiction over the FOOD  
3 ESTABLISHMENT.

4       **“Reminder”** means a written statement concerning the health RISK of consuming  
5 animal FOODS raw, undercooked, or without otherwise being processed to eliminate  
6 pathogens.

7       **“Re-service”** means the transfer of FOOD that is unused and returned by a  
8 CONSUMER after being served or sold and in the possession of the CONSUMER, to  
9 another PERSON.

10       **“Restrict”** means to limit activities of FOOD EMPLOYEE so that there is no RISK of  
11 transmitting a disease that is transmissible through FOOD and the FOOD EMPLOYEE  
12 does not work with exposed FOOD, clean EQUIPMENT, UTENSILS, LINENS, or unwrapped  
13 SINGLE-SERVICE OR SINGLE-USE ARTICLES.

14       **“Restricted egg”** means any check, dirty EGG, incubator reject, inedible, leaker, or  
15 loss as defined in 9 CFR 590.

16       **“Restricted use pesticide”** means a pesticide product that contains the active  
17 ingredients specified in 40 CFR 152.175 Pesticides classified for restricted use, and  
18 that is limited to use by or under the direct supervision of a certified applicator.

19       **“Risk”** means the likelihood that an adverse health effect will occur within a  
20 population as a result of a HAZARD in a FOOD.

21       **“Safe material”** means:

- 22       (1) An article manufactured from or composed of materials that may not  
23 reasonably be expected to result, directly or indirectly, in their becoming a  
24 component or otherwise affecting the characteristics of any FOOD;
- 25       (2) An additive that is used as specified in § 409 or 706 of the Federal Food,  
26 Drug, and Cosmetic Act; or
- 27       (3) Other materials that are not ADDITIVES and that are used in conformity with  
28 applicable regulations of the Food and Drug Administration.

29       **“Sanitization”** means the application of cumulative heat or chemicals on cleaned  
30 FOOD-CONTACT SURFACES that, when evaluated for efficacy, is sufficient to yield a

1 reduction of 5 logs, which is equal to a 99.999% reduction, of representative  
2 disease microorganisms of public health importance.

3 **“Sealed”** means free of cracks or other openings that allow the entry or passage of  
4 moisture.

5 **“Service animal”** means an animal such as a guide dog, signal dog, or other  
6 animal individually trained to provide assistance to an individual with a disability.

7 **“Servicing area”** means an operating base location to which a mobile FOOD  
8 ESTABLISHMENT or transportation vehicle returns regularly for such things as vehicle  
9 and equipment cleaning, discharging liquid or solid wastes, refilling water tanks and  
10 ice bins, and boarding FOOD.

11 **“Sewage”** means liquid waste containing animal or vegetable matter in suspension  
12 or solution and may include liquids containing chemicals in solution.

13 **“Shellfish control authority”** means a state, federal, foreign, tribal, or other  
14 government entity legally responsible for administering a program that includes  
15 certification of MOLLUSCAN SHELLFISH harvesters and DEALERS for interstate  
16 commerce.

17 **“Shellstock”** means raw, in-shell MOLLUSCAN SHELLFISH.

18 **“Shiga toxin-producing *Escherichia coli*”** (STEC) means any *E. coli* capable of  
19 producing Shiga toxins (also called verocytotoxins or “Shiga-like” toxins).  
20 Examples of serotypes of STEC include both O157 and non-O157 *E. coli*. Also  
21 see ENTEROHEMORRHAGIC *ESCHERICHIA COLI*.

22 **“Shucked shellfish”** means MOLLUSCAN SHELLFISH that have one or both shells  
23 removed.

24 **“Single-service articles”** means TABLEWARE, carry-out UTENSILS, and other items  
25 such as bags, containers, placemats, stirrers, straws, toothpicks, and wrappers that  
26 are designed and constructed for one time, one PERSON use after which they are  
27 intended for discard.

#### 28 **Single-Use Articles.**

29 (1) **“Single-use articles”** means UTENSILS and bulk FOOD containers designed  
30 and constructed to be used once and discarded.

1 (2) **“Single-use articles”** includes items such as wax paper, butcher paper,  
2 plastic wrap, formed aluminum FOOD containers, jars, plastic tubs or buckets,  
3 bread wrappers, pickle barrels, ketchup bottles, and number 10 cans which  
4 do not meet the materials, durability, strength, and cleanability specifications  
5 under Sections 4-101.11, 4-201.11, and 4-202.11 for multiuse UTENSILS.

6 **“Slacking”** means the process of moderating the temperature of a FOOD such as  
7 allowing a FOOD to gradually increase from a temperature of -23°C (-10°F) to -4°C  
8 (25°F) in preparation for deep-fat frying or to facilitate even heat penetration during  
9 the cooking of previously block-frozen FOOD such as shrimp.

10 **“Smooth”** means:

- 11 (1) A FOOD-CONTACT SURFACE having a surface free of pits and inclusions with a  
12 cleanability equal to or exceeding that of (100 grit) number 3 stainless steel;  
13 (2) A nonFOOD-CONTACT SURFACE of EQUIPMENT having a surface equal to that of  
14 commercial grade hot-rolled steel free of visible scale; and  
15 (3) A floor, wall, or ceiling having an even or level surface with no roughness or  
16 projections that render it difficult to clean.

17 **“Tableware”** means eating, drinking, and serving UTENSILS for table use such as  
18 flatware including forks, knives, and spoons; hollowware including bowls, cups,  
19 serving dishes, and tumblers; and plates.

20 **“Temperature measuring device”** means a thermometer, thermocouple,  
21 thermistor, or other device that indicates the temperature of FOOD, air, or water.

22 **Temporary food establishment.**

23 (1) **“Temporary food establishment”** means a FOOD ESTABLISHMENT that  
24 operates for a period of no more than 14 consecutive days in conjunction  
25 with a single event or celebration.

26 (2) **“Temporary food establishment” does not include:**

- 27 (a) A “temporary food service establishment” that is referenced in §  
28 21102(f) of Chapter 21, Title 10 GCA, and is defined as a FOOD  
29 ESTABLISHMENT, that operates for a period of no more than 180

1 consecutive days in conjunction with a single event or celebration  
2 which shall meet all the requirements of this Code; or

3 (b) Any other FOOD ESTABLISHMENT that operates for a period of no more  
4 than 180 consecutive days but less than 365 consecutive days.

5 **“USDA”** means the U.S. Department of Agriculture.

6 **“Utensil”** means a FOOD-CONTACT implement or container used in the storage,  
7 preparation, transportation, dispensing, sale, or service of FOOD, such as  
8 KITCHENWARE or TABLEWARE that is multiuse, SINGLE-SERVICE, or SINGLE-USE; gloves  
9 used in contact with FOOD; temperature sensing probes of FOOD TEMPERATURE  
10 MEASURING DEVICES; and probe-type price or identification tags used in contact with  
11 FOOD.

12 **“Variance”** means a written document issued by the REGULATORY AUTHORITY that  
13 authorizes a modification or waiver of one or more requirements of this Code if, in  
14 the opinion of the REGULATORY AUTHORITY, a health HAZARD or nuisance will not  
15 result from the modification or waiver.

16 **“Vending machine”** means a self-service device that, upon insertion of a coin,  
17 paper currency, token, card, or key, or by optional manual operation, dispenses  
18 unit servings of FOOD in bulk or in packages without the necessity of replenishing  
19 the device between each vending operation.

20 **“Vending machine location”** means the room, enclosure, space, or area where  
21 one or more VENDING MACHINES are installed and operated and includes the storage  
22 areas and areas on the PREMISES that are used to service and maintain the VENDING  
23 MACHINES.

24 **“Warewashing”** means the cleaning and SANITIZING of UTENSILS and FOOD-  
25 CONTACT SURFACES of EQUIPMENT.

26 **“Whole-muscle, intact beef”** means whole muscle beef that is not injected,  
27 mechanically tenderized, reconstructed, or scored and marinated, from which  
28 beef steaks may be cut.

## 1 Chapter

2 **2 Management and Personnel**

## 3 Parts

4 2-1 SUPERVISION

5 2-2 EMPLOYEE HEALTH

6 2-3 PERSONAL CLEANLINESS

7 2-4 HYGIENIC PRACTICES

8 2-1 SUPERVISION

9 **Subparts**

10 2-101 Responsibility

11 2-102 Knowledge

12 2-103 Duties

13 **Responsibility** 2-101.11 Assignment.\*

14 (A) Except as specified in ¶ (B) of this section, the PERMIT HOLDER  
 15 shall be the PERSON IN CHARGE or shall designate a PERSON IN  
 16 CHARGE and shall ensure that a PERSON IN CHARGE is present at  
 17 the FOOD ESTABLISHMENT during all hours of operation.

18 (B) In a FOOD ESTABLISHMENT with two or more separately PERMITTED  
 19 departments that are the legal responsibility of the same  
 20 PERMIT HOLDER and that are located on the same PREMISES, the  
 21 PERMIT HOLDER may, during specific time periods when food is  
 22 not being prepared, packaged, or served, designate a single  
 23 PERSON IN CHARGE who is present on the PREMISES during all  
 24 hours of operation, and who is responsible for each separately  
 25 PERMITTED FOOD ESTABLISHMENT on the PREMISES.

26 **Knowledge** 2-102.11 Demonstration.\*

27 Based on the RISKS inherent to the FOOD operation, during inspections  
 28 and upon request the PERSON IN CHARGE shall demonstrate to the

1 REGULATORY AUTHORITY knowledge of foodborne disease prevention,  
2 application of the HAZARD Analysis and CRITICAL CONTROL POINT  
3 principles, and the requirements of this Code. The PERSON IN CHARGE  
4 shall demonstrate this knowledge by:

5 (A) Complying with this Code by having no violations of CRITICAL  
6 ITEMS during the current inspection;

7 (B) Being a certified FOOD protection manager who has shown  
8 proficiency of required information through passing a test that  
9 is part of an ACCREDITED PROGRAM; or

10 (C) Responding correctly to the inspector's questions as they  
11 relate to the specific FOOD operation. The areas of knowledge  
12 include:

13 (1) Describing the relationship between the prevention of  
14 foodborne disease and the personal hygiene of a FOOD  
15 EMPLOYEE;

16 (2) Explaining the responsibility of the PERSON IN CHARGE for  
17 preventing the transmission of foodborne disease by a  
18 FOOD EMPLOYEE who has a disease or medical condition  
19 that may cause foodborne disease;

20 (3) Describing the symptoms associated with the diseases  
21 that are transmissible through FOOD;

22 (4) Explaining the significance of the relationship between  
23 maintaining the time and temperature of POTENTIALLY  
24 HAZARDOUS FOOD (TIME/TEMPERATURE CONTROL FOR  
25 SAFETY FOOD) and the prevention of foodborne illness;

26 (5) Explaining the HAZARDS involved in the consumption of  
27 raw or undercooked MEAT, POULTRY, EGGS, and FISH:

28 (6) Stating the required FOOD temperatures and times for  
29 safe cooking of POTENTIALLY HAZARDOUS FOOD  
30 (TIME/TEMPERATURE CONTROL FOR SAFETY FOOD) including

- 1 MEAT, POULTRY, EGGS, and FISH;
- 2 (7) Stating the required temperatures and times for
- 3 the safe refrigerated storage, hot holding, cooling,
- 4 and reheating of POTENTIALLY HAZARDOUS FOOD
- 5 (TIME/TEMPERATURE CONTROL FOR SAFETY FOOD);
- 6 (8) Describing the relationship between the prevention of
- 7 foodborne illness and the management and control of
- 8 the following:
- 9 (a) Cross contamination,
- 10 (b) Hand contact with READY-TO-EAT FOODS,
- 11 (c) Handwashing, and
- 12 (d) Maintaining the FOOD ESTABLISHMENT in a clean
- 13 condition and in good repair;
- 14 (9) Describing FOODS identified as MAJOR FOOD ALLERGENS
- 15 and the symptoms that a MAJOR FOOD ALLERGEN could
- 16 cause in a sensitive individual who has an allergic
- 17 reaction.
- 18 (10) Explaining the relationship between FOOD safety and
- 19 providing EQUIPMENT that is:
- 20 (a) Sufficient in number and capacity, and
- 21 (b) Properly designed, constructed, located,
- 22 installed, operated, maintained, and cleaned;
- 23 (11) Explaining correct procedures for cleaning and
- 24 SANITIZING UTENSILS and FOOD-CONTACT SURFACES of
- 25 EQUIPMENT;
- 26 (12) Identifying the source of water used and measures
- 27 taken to ensure that it remains protected from
- 28 contamination such as providing protection from
- 29 backflow and precluding the creation of cross
- 30 connections;

- 1 (13) Identifying POISONOUS OR TOXIC MATERIALS in the FOOD  
2 ESTABLISHMENT and the procedures necessary to ensure  
3 that they are safely stored, dispensed, used, and  
4 disposed of according to LAW;
- 5 (14) Identifying CRITICAL CONTROL POINTS in the operation  
6 from purchasing through sale or service that when not  
7 controlled may contribute to the transmission of  
8 foodborne illness and explaining steps taken to ensure  
9 that the points are controlled in accordance with the  
10 requirements of this Code;
- 11 (15) Explaining the details of how the PERSON IN CHARGE and  
12 FOOD EMPLOYEES comply with the HACCP PLAN if a plan  
13 is required by the LAW, this Code, or an agreement  
14 between the REGULATORY AUTHORITY and the FOOD  
15 ESTABLISHMENT;
- 16 (16) Explaining the responsibilities, rights, and authorities  
17 assigned by this Code to the:
- 18 (a) FOOD EMPLOYEE,  
19 (b) CONDITIONAL EMPLOYEE,  
20 (c) PERSON IN CHARGE,  
21 (d) REGULATORY AUTHORITY; and
- 22 (17) Explaining how the PERSON IN CHARGE, FOOD EMPLOYEES,  
23 and CONDITIONAL EMPLOYEES comply with reporting  
24 responsibilities and EXCLUSION or RESTRICTION of FOOD  
25 EMPLOYEES.

26 **2-102.20 Food Protection Manager Certification.**

27 A PERSON IN CHARGE who demonstrates knowledge by being a FOOD  
28 protection manager that is certified by a FOOD protection manager  
29 certification program that is evaluated and listed by a Conference for  
30 Food Protection-recognized accrediting agency as conforming to the

1 Conference for Food Protection Standards for Accreditation of Food  
2 Protection Manager Certification Programs is deemed to comply with  
3 ¶ 2-102.11(B), or a similar program approved by the REGULATORY  
4 AUTHORITY.

5 **Duties**

5 **2-103.11 Person in Charge.**

6 The PERSON IN CHARGE shall ensure that:

- 7 (A) FOOD ESTABLISHMENT operations are not conducted in a private  
8 home or in a room used as living or sleeping quarters as  
9 specified under §6-202.111;
- 10 (B) PERSONS unnecessary to the FOOD ESTABLISHMENT operation  
11 are not allowed in the FOOD preparation, FOOD storage, or  
12 WAREWASHING areas, except that brief visits and tours may be  
13 authorized by the PERSON IN CHARGE if steps are taken to  
14 ensure that exposed FOOD; clean EQUIPMENT, UTENSILS, and  
15 LINENS; and unwrapped SINGLE-SERVICE and SINGLE-USE  
16 ARTICLES are protected from contamination;
- 17 (C) EMPLOYEES and other PERSONS such as delivery and  
18 maintenance PERSONS and pesticide applicators entering the  
19 FOOD preparation, FOOD storage, and WAREWASHING areas  
20 comply with this Code;
- 21 (D) EMPLOYEES are effectively cleaning their hands, by routinely  
22 monitoring the EMPLOYEES' handwashing;
- 23 (E) EMPLOYEES are visibly observing FOODS as they are received to  
24 determine that they are from APPROVED sources, delivered at  
25 the required temperatures, protected from contamination,  
26 UNADULTERATED, and accurately presented, by routinely  
27 monitoring the EMPLOYEES' observations and periodically  
28 evaluating FOODS upon their receipt;
- 29 (F) EMPLOYEES are properly cooking POTENTIALLY HAZARDOUS FOOD  
30 (TIME/TEMPERATURE CONTROL FOR SAFETY FOOD), being

1 particularly careful in cooking those FOODS known to cause  
2 severe foodborne illness and death, such as EGGS and  
3 COMMINUTED MEATS, through daily oversight of the EMPLOYEES'  
4 routine monitoring of the cooking temperatures using  
5 appropriate temperature measuring devices properly scaled  
6 and calibrated as specified under §4-203.11 and ¶  
7 4-502.11(B);

8 (G) EMPLOYEES are using proper methods to rapidly cool  
9 POTENTIALLY HAZARDOUS FOODS (TIME/TEMPERATURE CONTROL FOR  
10 SAFETY FOODS) that are not held hot or are not for consumption  
11 within 4 hours, through daily oversight of the EMPLOYEES'  
12 routine monitoring of FOOD temperatures during cooling;

13 (H) CONSUMERS who order raw or partially cooked READY-TO-EAT  
14 FOODS of animal origin are informed as specified under §  
15 3-603.11 that the FOOD is not cooked sufficiently to ensure its  
16 safety;

17 (I) EMPLOYEES are properly SANITIZING cleaned multiuse EQUIPMENT  
18 and UTENSILS before they are reused, through routine  
19 monitoring of solution temperature and exposure time for hot  
20 water SANITIZING, and chemical concentration, pH, temperature,  
21 and exposure time for chemical SANITIZING;

22 (J) CONSUMERS are notified that clean TABLEWARE is to be used  
23 when they return to self-service areas such as salad bars and  
24 buffets as specified under § 3-304.16;

25 (K) Except when APPROVAL is obtained from the REGULATORY  
26 AUTHORITY as specified in ¶ 3-301.11(D), EMPLOYEES are  
27 preventing cross-contamination of READY-TO-EAT FOOD with  
28 bare hands by properly using suitable UTENSILS such as deli  
29 tissue, spatulas, tongs, single-use gloves, or dispensing  
30 EQUIPMENT;

1 (L) EMPLOYEES are properly trained in FOOD safety as it relates to  
2 their assigned duties; and

3 (M) FOOD EMPLOYEES and CONDITIONAL EMPLOYEES are informed of  
4 their responsibility to report in accordance with LAW, to the  
5 PERSON IN CHARGE, information about their health and activities  
6 as they relate to diseases that are transmissible through FOOD,  
7 as specified under ¶ 2-201.11(A).

8

9 **2-2 EMPLOYEE HEALTH**

10 ***Subpart***

11 **2-201 Responsibilities of Permit Holder, Person in**  
12 **Charge, Food Employees, and Conditional**  
13 **Employees.\***

14 ***Responsibilities* 2-201.11 Responsibility of Permit Holder, Person Charge,**  
15 ***and Reporting* Conditional Employees.\***

16 ***Symptoms*** (A) The PERMIT HOLDER shall require FOOD EMPLOYEES and  
17 ***and Diagnosis*** (CONDITIONAL EMPLOYEES to report to the PERSON IN CHARGE  
18 information about their health and activities as they relate to  
19 diseases that are transmissible through FOOD. A FOOD  
20 EMPLOYEE or CONDITIONAL EMPLOYEE shall report the information  
21 in a manner that allows the PERSON IN CHARGE to reduce the  
22 RISK of foodborne disease transmission, including providing  
23 necessary additional information, such as the date of onset of  
24 symptoms and an illness, or of a diagnosis without symptoms if  
25 the FOOD EMPLOYEE or CONDITIONAL EMPLOYEE:

- 26 *reportable symptoms* (1) Has any of the following symptoms:
- 27 (a) Vomiting,
  - 28 (b) Diarrhea,
  - 29 (c) Jaundice,
  - 30 (d) Sore throat with fever, or

- 1 (e) A lesion containing pus such as a boil or  
 2 infected wound that is open or draining and is:  
 3 (i) On the hands or wrists, *unless an*  
 4 *impermeable cover such as a finger cot or*  
 5 *stall protects the lesion and a SINGLE-USE*  
 6 *glove is worn over the impermeable*  
 7 *cover,*  
 8 (ii) On exposed portions of the arms, *unless*  
 9 *the lesion is protected by an impermeable*  
 10 *cover, or*  
 11 (iii) On other parts of the body, *unless the*  
 12 *lesion is covered by a dry, durable, tight-*  
 13 *fitting bandage;*
- 14 *reportable* (2) Has an illness diagnosed by a HEALTH PRACTITIONER  
 15 *diagnosis* due to:  
 16 (a) Norovirus,  
 17 (b) Hepatitis A virus,  
 18 (c) *Shigella* spp.,  
 19 (d) ENTEROHEMORRHAGIC or SHIGA TOXIN-PRODUCING  
 20 *ESCHERICHIA COLI*, or  
 21 (e) *Salmonella* Typhi;
- 22 *reportable* (3) Had a previous illness, diagnosed by a  
 23 *past illness* HEALTH PRACTITIONER, within the past 3 months due to  
 24 *Salmonella* Typhi, without having received antibiotic  
 25 therapy, as determined by a HEALTH PRACTITIONER;
- 26 *reportable* (4) Has been exposed to, or is the suspected source  
 27 *history of* of, a CONFIRMED DISEASE OUTBREAK, because the  
 28 *exposure* FOOD EMPLOYEE or CONDITIONAL EMPLOYEE consumed or  
 29 prepared FOOD implicated in the outbreak, or consumed  
 30 FOOD at an event prepared by a PERSON who is infected

- or ill with:
  - (a) Norovirus within the past 48 hours of the last exposure,
  - (b) ENTEROHEMORRHAGIC or SHIGA TOXIN-PRODUCING *ESCHERICHIA COLI*, or *Shigella* spp. within the past 3 days of the last exposure,
  - (c) *Salmonella* Typhi within the past 14 days of the last exposure, or
  - (d) Hepatitis A virus within the past 30 days of the last exposure; or
  
- 5) Has been exposed by attending or working in a setting where there is a CONFIRMED DISEASE OUTBREAK, or living in the same household as, and has knowledge about, an individual who works or attends a setting where there is a CONFIRMED DISEASE OUTBREAK, or living in the same household as, and has knowledge about, an individual diagnosed with an illness caused by:
  - (a) Norovirus within the past 48 hours of the last exposure,
  - (b) ENTEROHEMORRHAGIC or SHIGA TOXIN-PRODUCING *ESCHERICHIA COLI*, or *Shigella* spp. within the past 3 days of the last exposure,
  - (c) *Salmonella* Typhi within the past 14 days of the last exposure, or
  - (d) Hepatitis A virus within the past 30 days of the last exposure.
  
- (B) The PERSON IN CHARGE shall notify the REGULATORY AUTHORITY when a FOOD EMPLOYEE is:
  - (1) Jaundiced, or

- 1 *regulatory authority* (2) Diagnosed with an illness due to a pathogen as  
 2 specified under Subparagraphs (A)(2)(a) - (e) of this  
 3 section.
- 4 *responsibility of* (C) The PERSON IN CHARGE shall ensure that a CONDITIONAL  
 5 *the person in charge* EMPLOYEE:  
 6 *to prohibit a conditional* (1) Who exhibits or reports a symptom, or who reports  
 7 *employee from becoming* a diagnosed illness as specified under  
 8 *a food employee* Subparagraphs (A)(1) - (3) of this section, is prohibited  
 9 from becoming a FOOD EMPLOYEE until the CONDITIONAL  
 10 EMPLOYEE meets the criteria for the specific symptoms  
 11 or diagnosed illness as specified under § 2-201.13; and  
 12 (2) Who will work as a FOOD EMPLOYEE in a FOOD  
 13 ESTABLISHMENT that serves as a HIGHLY SUSCEPTIBLE  
 14 POPULATION and reports a history of exposure as  
 15 specified under Subparagraphs (A)(4) – (5), is  
 16 prohibited from becoming a FOOD EMPLOYEE until the  
 17 CONDITIONAL EMPLOYEE meets the criteria as specified  
 18 under ¶ 2-201.13(I).
- 19 *responsibility of* (D) The PERSON IN CHARGE shall ensure that a FOOD EMPLOYEE  
 20 *the person in charge* who exhibits or reports a symptom, or who reports a  
 21 *to exclude or restrict* diagnosed illness or a history of exposure as specified  
 22 under Subparagraphs (A)(1) - (5) of this section is:  
 23 (1) EXCLUDED as specified under ¶¶ 2-201.12 (A) - (C), and  
 24 Subparagraphs (D)(1), (E)(1), (F)(1), or (G)(1) and in  
 25 compliance with the provisions specified under  
 26 ¶¶ 2-201.13(A) - (G); or  
 27 (2) RESTRICTED as specified under Subparagraphs 2-  
 28 201.12 (D)(2), (E)(2), (F)(2), (G)(2), or ¶¶ 2-201.12(H)  
 29 or (I) and in compliance with the provisions specified  
 30 under ¶¶ 2-201.13(D) - (I).

- 1 *responsibility of* (E) A FOOD EMPLOYEE or CONDITIONAL EMPLOYEE shall report to  
 2 *food employees and* the PERSON IN CHARGE the information as specified under  
 3 *conditional* ¶ (A) of this section.  
 4 *employees to report*
- 5
- 6 *responsibility of* (F) A FOOD EMPLOYEE shall:  
 7 *food employees* (1) Comply with an EXCLUSION as specified under  
 8 *to comply* ¶¶ 2-201.12(A)-(C) and Subparagraphs 2-201.12(D)(1),  
 9 (E)(1), (F)(1), or (G)(1) and with the provisions  
 10 specified under ¶¶ 2-201.13(A) - (G); or  
 11 (2) Comply with a RESTRICTION as specified under  
 12 Subparagraphs 2-201.12(D)(2), (E)(2), (F)(2), (G)(2), or  
 13 ¶¶ 2-201.12 (H) or (I) and comply with the provisions  
 14 specified under ¶¶ 2-201.13(D) - (I).
- 15 *conditions of* **2-201.12 Exclusions and Restrictions.\***  
 16 *exclusion* The PERSON IN CHARGE shall EXCLUDE or RESTRICT a FOOD  
 17 *and restriction* EMPLOYEE from a FOOD ESTABLISHMENT in accordance with the  
 18 following:  
 19
- 20 *Symptomatic* (A) *Except when the symptom is from a noninfectious*  
 21 *with vomiting* *condition,* EXCLUDE a FOOD EMPLOYEE if the FOOD  
 22 *or diarrhea* EMPLOYEE is:  
 23 (1) Symptomatic with vomiting or diarrhea; or  
 24 (2) Symptomatic with vomiting or diarrhea and diagnosed  
 25 with an infection from Norovirus, *Shigella* spp., or  
 26 ENTEROHEMORRHAGIC or SHIGA TOXIN-PRODUCING *E. COLI.*
- 27 *jaundiced or* (B) EXCLUDE a FOOD EMPLOYEE who is:  
 28 *diagnosed* (1) Jaundiced and the onset of jaundice occurred within  
 29 *with hepatitis A* the last 7 calendar days, *unless the FOOD EMPLOYEE*  
 30 *infection* *provides to the PERSON IN CHARGE written medical*

- 1 *diagnosed with* (F) If a FOOD EMPLOYEE is diagnosed with an infection from  
 2 *EHEC* ENTEROHEMORRHAGIC or SHIGA TOXIN-PRODUCING *E. COLI*, and  
 3 *or STEC and* is ASYMPTOMATIC:  
 4 *asymptomatic* (1) EXCLUDE the FOOD EMPLOYEE who works in a FOOD  
 5 ESTABLISHMENT serving a HIGHLY SUSCEPTIBLE  
 6 POPULATION; or  
 7 (2) RESTRICT the FOOD EMPLOYEE who works in a FOOD  
 8 ESTABLISHMENT not serving a HIGHLY SUSCEPTIBLE  
 9 POPULATION.
- 10 *symptomatic with* (G) If a FOOD EMPLOYEE is ill with symptoms of acute onset of  
 11 *sore throat with* sore throat with fever:  
 12 *fever* (1) EXCLUDE the FOOD EMPLOYEE who works in a FOOD  
 13 ESTABLISHMENT serving a HIGHLY SUSCEPTIBLE  
 14 POPULATION; or  
 15 (2) RESTRICT the FOOD EMPLOYEE who works in a FOOD  
 16 ESTABLISHMENT not serving a HIGHLY SUSCEPTIBLE  
 17 POPULATION.
- 18 *symptomatic with* (H) If a FOOD EMPLOYEE is infected with a skin lesion  
 19 *uncovered* containing pus such as a boil or infected wound that is  
 20 *infected* open or draining and not properly covered as specified  
 21 *wound or pustular* under Subparagraph 2-201.11(A)(1)(e), RESTRICT the FOOD  
 22 *boil* EMPLOYEE.
- 23  
 24 *exposed to* (I) If a FOOD EMPLOYEE is exposed to a foodborne pathogen  
 25 *foodborne* as specified under Subparagraphs 2-201.11(A)(4) or (5),  
 26 *pathogen and* RESTRICT the FOOD EMPLOYEE who works in a FOOD ESTA-  
 27 *works in food* LISHMENT serving a HIGHLY SUSCEPTIBLE POPULATION.  
 28 *establishment*  
 29 *serving HSP*  
 30

1	<b>Managing</b>	<b>2-201.13</b>	<b>Removal, Adjustment, or Retention of Exclusions</b>
2	<b>Exclusions</b>		<b>and Restrictions.</b>
3	<b>and</b>		The PERSON IN CHARGE shall adhere to the following conditions
4	<b>Restrictions</b>		when removing, adjusting, or retaining the EXCLUSION or RESTRICTION
5			of a FOOD EMPLOYEE:
6		(A)	<i>Except when a FOOD EMPLOYEE is diagnosed with an infection</i>
7			<i>from hepatitis A virus or Salmonella Typhi:</i>
8	<i>removing exclusion</i>	(1)	Reinstate a FOOD EMPLOYEE who was EXCLUDED as
9	<i>for food employee</i>		specified under Subparagraph 2-201.12(A)(1) if the
10	<i>who was symptomatic</i>		FOOD EMPLOYEE:
11	<i>and not diagnosed</i>	(a)	Is ASYMPTOMATIC for at least 24 hours; or
12		b)	Provides to the PERSON IN CHARGE written medical
13			documentation from a HEALTH PRACTITIONER that
14			states the symptom is from a noninfectious
15			condition.
16	<i>Norovirus diagnosis</i>	(2)	If a FOOD EMPLOYEE was diagnosed with an infection
17			from Norovirus and EXCLUDED as specified under
18			Subparagraph 2-201.12(A)(2):
19	<i>adjusting exclusion for</i>	(a)	RESTRICT the FOOD EMPLOYEE, who is
20	<i>food employee who</i>		ASYMPTOMATIC for at least 24 hours and works
21	<i>was symptomatic and</i>		in a FOOD ESTABLISHMENT not serving a HIGHLY
22	<i>is now asymptomatic</i>		SUSCEPTIBLE POPULATION, until the conditions for
23			reinstatement as specified under Subparagraphs
24			(D)(1) or (2) of this section are met; or
25	<i>retaining exclusion for</i>	(b)	Retain the EXCLUSION for the FOOD EMPLOYEE,
26	<i>food employee who</i>		who is ASYMPTOMATIC for at least 24 hours
27	<i>was asymptomatic</i>		and works in a FOOD ESTABLISHMENT that
28	<i>and is now asymptomatic</i>		serves a HIGHLY SUSCEPTIBLE POPULATION,
29	<i>and works in food</i>		until the conditions for reinstatement as
30	<i>establishment serving HSP</i>		specified under Subparagraphs (D)(1) or (2) of

- 1 this section are met.
- 2 *Shigella spp.* (3) If a FOOD EMPLOYEE was diagnosed with an infection
- 3 *Diagnosis* from *Shigella* spp. and EXCLUDED as specified under
- 4 Subparagraph 2-201.12(A)(2):
- 5 *adjusting exclusion for* (a) RESTRICT the FOOD EMPLOYEE, who is
- 6 *food employee who* ASYMPTOMATIC for at least 24 hours and works
- 7 *was symptomatic and* in a FOOD ESTABLISHMENT not serving a HIGHLY
- 8 *is now asymptomatic* SUSCEPTIBLE POPULATION, until the conditions for
- 9 reinstatement as specified under Subparagraphs
- 10 (E)(1) or (2) of this section are met; or
- 11 *retaining exclusion for* (b) Retain the EXCLUSION for the FOOD EMPLOYEE,
- 12 *food employee who* who is ASYMPTOMATIC for at least 24 hours and
- 13 *was asymptomatic and* works in a FOOD ESTABLISHMENT that serves a
- 14 *is now asymptomatic* HIGHLY SUSCEPTIBLE POPULATION, until the
- 15 conditions for reinstatement as specified under
- 16 Subparagraphs (E)(1) or (2) , or (E)(1) and (3)(a)
- 17 of this section are met.
- 18 *EHEC or STEC* (4) If a FOOD EMPLOYEE was diagnosed with an infection
- 19 *Diagnosis* from ENTEROHEMORRHAGIC or SHIGA TOXIN- PRODUCING
- 20 *ESCHERICHIA COLI* and EXCLUDED as specified under
- 21 Subparagraph 2-201.12(A)(2):
- 22 *adjusting exclusion for* (a) RESTRICT the FOOD EMPLOYEE, who is
- 23 *food employee who* ASYMPTOMATIC for at least 24 hours and
- 24 *was symptomatic and* works in a FOOD ESTABLISHMENT not serving
- 25 *is now asymptomatic* a HIGHLY SUSCEPTIBLE POPULATION, until the
- 26 conditions for reinstatement as specified under
- 27 Subparagraphs (F)(1) or (2) of this section are
- 28 met; or
- 29 *retaining exclusion* (b) Retain the EXCLUSION for the FOOD EMPLOYEE,
- 30 *for food employee* who is ASYMPTOMATIC for at least 24 hours and

- 1 *who was symptomatic* works in a FOOD ESTABLISHMENT that serves  
 2 *and is now asymptomatic* a HIGHLY SUSCEPTIBLE POPULATION, until the  
 3 *and works in food* conditions for reinstatement as specified under  
 4 *establishment serving HSP* Subparagraphs (F)(1) or (2) are met.  
 5
- 6 *hepatitis A virus* (B) Reinstatement a FOOD EMPLOYEE who was EXCLUDED as specified  
 7 *or jaundice* under ¶ 2-201.12(B) if the PERSON IN CHARGE obtains  
 8 *diagnosis –* APPROVAL from the REGULATORY AUTHORITY and one of the  
 9 *removing* following conditions is met;  
 10 *exclusions* (1) The FOOD EMPLOYEE has been jaundiced for more than 7  
 11 calendar days;  
 12 (2) The anicteric FOOD EMPLOYEE has been symptomatic  
 13 with symptoms other than jaundice for more than 14  
 14 calendar days; or  
 15 (3) The FOOD EMPLOYEE provides to the PERSON IN CHARGE  
 16 written medical documentation from a HEALTH  
 17 PRACTITIONER stating that the FOOD EMPLOYEE is free of a  
 18 hepatitis A virus infection.
- 19 *S. Typhi* (C) Reinstatement a FOOD EMPLOYEE who was EXCLUDED as  
 20 *diagnosis –* (specified under ¶ 2-201.12(C) if:  
 21 *removing* (1) The PERSON IN CHARGE obtains APPROVAL from the  
 22 *exclusions* REGULATORY AUTHORITY; and  
 23 (2) The FOOD EMPLOYEE provides to the PERSON IN CHARGE  
 24 written medical documentation from a HEALTH  
 25 PRACTITIONER that states the FOOD EMPLOYEE is free from  
 26 *S. Typhi* infection.
- 27 *Norovirus* (D) Reinstatement a FOOD EMPLOYEE who was EXCLUDED as  
 28 *diagnosis –* specified under Subparagraphs 2-201.12(A)(2) or (D)(1) who  
 29 *removing* was RESTRICTED under Subparagraph 2-201.12(D)(2) if the  
 30 *exclusion* PERSON IN CHARGE obtains APPROVAL from the REGULATORY

1 or restriction

AUTHORITY and one of the following conditions is met:

2 (1) The EXCLUDED or RESTRICTED FOOD EMPLOYEE provides to  
3 the PERSON IN CHARGE written medical documentation  
4 from a HEALTH PRACTITIONER stating that the FOOD  
5 EMPLOYEE is free of a Norovirus infection;

6 (2) The FOOD EMPLOYEE was EXCLUDED or RESTRICTED after  
7 symptoms of vomiting or diarrhea resolved, and more  
8 than 48 hours have passed since the FOOD EMPLOYEE  
9 became ASYMPTOMATIC; or

10 (3) The FOOD EMPLOYEE was EXCLUDED or RESTRICTED and  
11 did not develop symptoms and more than 48 hours  
12 have passed since the FOOD EMPLOYEE was diagnosed.

13 *Shigella spp.*  
14 *diagnosis –*  
15 *removing*  
16 *exclusion or*  
17 *restriction*

(E) Reinstate a FOOD EMPLOYEE who was EXCLUDED as specified  
under Subparagraphs 2-201.12(A)(2) or (E)(1) or who was  
RESTRICTED under Subparagraph 2-201.12(E)(2) if the PERSON  
IN CHARGE obtains APPROVAL from the REGULATORY AUTHORITY  
and one of the following conditions is met:

18 (1) The EXCLUDED or RESTRICTED FOOD EMPLOYEE provides to  
19 the PERSON IN CHARGE written medical documentation  
20 from a HEALTH PRACTITIONER stating that the FOOD  
21 EMPLOYEE is free of a *Shigella spp.* infection based on  
22 test results showing 2 consecutive negative stool  
23 specimen cultures that are taken:

24 (a) Not earlier than 48 hours after discontinuance of  
25 antibiotics, and

26 (b) At least 24 hours apart;

27 (2) The FOOD EMPLOYEE was EXCLUDED or RESTRICTED after  
28 symptoms of vomiting or diarrhea resolved, and more  
29 than 7 calendar days have passed since the FOOD  
30 EMPLOYEE became ASYMPTOMATIC; or

1 (3) The FOOD EMPLOYEE was EXCLUDED or RESTRICTED and  
2 did not develop symptoms and more than 7 calendar  
3 days have passed since the FOOD EMPLOYEE was  
4 diagnosed.

5 *EHEC or STEC* (F) Reinstatement a FOOD EMPLOYEE who was EXCLUDED or  
6 *diagnosis –* RESTRICTED as specified under Subparagraphs 2-201. 12(A)(2)  
7 *removing* or (F)(1) or who was RESTRICTED under Subparagraph 2-201.12  
8 *exclusion or* (F)(2) if the PERSON IN CHARGE obtains APPROVAL from  
9 *restriction* the REGULATORY AUTHORITY and one of the following conditions  
10 is met:

11 (1) The EXCLUDED or RESTRICTED FOOD EMPLOYEE provides  
12 to the PERSON IN CHARGE written medical documentation  
13 from a HEALTH PRACTITIONER stating that the FOOD  
14 EMPLOYEE is free of an infection from  
15 ENTEROHEMORRHAGIC or SHIGA TOXIN-PRODUCING  
16 *ESCHERICHIA COLI* based on test results that show 2  
17 consecutive negative stool specimen cultures that are  
18 taken:

19 (a) Not earlier than 48 hours after discontinuance of  
20 antibiotics; and

21 (b) At least 24 hours apart;

22 (2) The FOOD EMPLOYEE was EXCLUDED or RESTRICTED after  
23 symptoms of vomiting or diarrhea resolved and more  
24 than 7 calendar days have passed since the FOOD  
25 EMPLOYEE became ASYMPTOMATIC; or

26 (3) The FOOD EMPLOYEE was EXCLUDED or RESTRICTED and  
27 did not develop symptoms and more than 7 days have  
28 passed since the FOOD EMPLOYEE was diagnosed.

29 *sore throat with* (G) Reinstatement a FOOD EMPLOYEE who was EXCLUDED or  
30 *fever-* RESTRICTED as specified under Subparagraphs

- 1 *removing*  
 2 *exclusion*  
 3 *or restriction*  
 4  
 5  
 6  
 7  
 8  
 9  
 10  
 11 *Uncovered* (H) Reinstatement of a FOOD EMPLOYEE who was RESTRICTED as  
 12 *infected* specified under ¶ 2-201.12(H) if the skin, infected wound  
 13 *wound or* cut, or pustular boil is properly covered with one of the  
 14 *pustular* following:  
 15 *boil – removing* (1) An impermeable cover such as a finger cot or  
 16 *restriction* stall and a single-use glove over the impermeable cover  
 17 if the infected wound or pustular boil is on the hand,  
 18 finger, or wrist;  
 19 (2) An impermeable cover on the arm if the infected  
 20 wound or pustular boil is on the arm; or  
 21 (3) A dry, durable, tight-fitting bandage if the infected  
 22 wound or pustular boil is on another part of the body.
- 23 *exposure to* (I) Reinstatement of a FOOD EMPLOYEE who was RESTRICTED as  
 24 *foodborne* specified under ¶ 2-201.12(I) and was exposed to one of  
 25 *pathogen* the following pathogens as specified under Subparagraph  
 26 *and works in* 2-201.11(A)(4) or (5):  
 27 *food establishment*  
 28 *serving HSP – removing*  
 29 *restriction*  
 30

- 1 *Norovirus* (1) Norovirus and one of the following conditions is met:
- 2 (a) More than 48 hours have passed since the last
- 3 day the FOOD EMPLOYEE was potentially exposed;
- 4 or
- 5 (b) More than 48 hours have passed since the FOOD
- 6 EMPLOYEE'S household contact became
- 7 ASYMPTOMATIC.
- 8 *Shigella spp., EHEC,* (2) *Shigella* spp. or ENTEROHEMORRHAGIC or SHIGA TOXIN-
- 9 *or STEC* PRODUCING *ESCHERICHIA COLI* and one of the following
- 10 conditions is met:
- 11 (a) More than 3 calendar days have passed since
- 12 the last day the FOOD EMPLOYEE was potentially
- 13 exposed; or
- 14 (b) More than 3 calendar days have passed since
- 15 the FOOD EMPLOYEE'S household contact became
- 16 ASYMPTOMATIC.
- 17 *S. Typhi* (3) *S. Typhi* and one of the following conditions is met:
- 18 (a) More than 14 calendar days have passed since
- 19 the last day the FOOD EMPLOYEE was potentially
- 20 exposed; or
- 21 (b) More than 14 calendar days have passed since
- 22 the FOOD EMPLOYEE'S household contact became
- 23 ASYMPTOMATIC.
- 24 *hepatitis A* (4) Hepatitis A virus and one of the following conditions is
- 25 met:
- 26 (a) The FOOD EMPLOYEE is immune to hepatitis A
- 27 virus infection because of a prior illness from
- 28 hepatitis A;
- 29 (b) The FOOD EMPLOYEE is immune to hepatitis A
- 30 virus infection because of vaccination against

- 1 hepatitis A;
- 2 (c) The FOOD EMPLOYEE is immune to hepatitis A
- 3 virus infection because of IgG administration;
- 4 (d) More than 30 calendar days have passed since
- 5 the last day the FOOD EMPLOYEE was potentially
- 6 exposed;
- 7 (e) More than 30 calendar days have passed since
- 8 the FOOD EMPLOYEE’S household contact became
- 9 jaundiced; or
- 10 (f) The FOOD EMPLOYEE does not use an alternative
- 11 procedure that allows bare hand contact with
- 12 READY-TO-EAT FOOD until at least 30 days after
- 13 the potential exposure, as specified in
- 14 Subparagraphs (l)(4)(d) and (e) of this section,
- 15 and the FOOD EMPLOYEE receives additional
- 16 training about:
  - 17 (i) Hepatitis A symptoms and preventing the
  - 18 transmission of infection,
  - 19 (ii) Proper handwashing procedures, and
  - 20 (iii) Protecting READY-TO-EAT FOOD from
  - 21 contamination introduced by bare hand
  - 22 contact.

**2-3 PERSONAL CLEANLINESS**

***Subparts***

- 25 **2-301 Hands and Arms**
- 26 **2-302 Fingernails**
- 27 **2-303 Jewelry**
- 28 **2-304 Outer Clothing**

***Hands and* 2-301.11 Clean Condition.\***

**1 Arms**

FOOD EMPLOYEES shall keep their hands and exposed portions of their arms clean.

**2-301.12 Cleaning Procedure.\***

(A) Except as specified in ¶ (D) of this section, FOOD EMPLOYEES shall clean their hands and exposed portions of their arms, including surrogate prosthetic devices for hands or arms for at least 20 seconds, using a cleaning compound in a HANDWASHING SINK that is equipped as specified under § 5-202.12 and Subpart 6-301.

(B) FOOD EMPLOYEES shall use the following cleaning procedure in the order stated to clean their hands and exposed portions of their arms, including surrogate prosthetic devices for hands and arms.

(1) Rinse under clean, running warm water;

(2) Apply an amount of cleaning compound recommended by the cleaning compound manufacturer;

(3) Rub together vigorously for at least 10 to 15 seconds while:

(a) Paying particular attention to removing soil from underneath the fingernails during the cleaning procedure, and

(b) Creating friction on the surfaces of the hands and arms or surrogate prosthetic devices for hands and arms, finger tips, and areas between the fingers.

(4) Thoroughly rinse under clean, running warm water; and

(5) Immediately follow the cleaning procedure with thorough drying using a method as specified under § 6-301.12.

- 1 (C) *To avoid recontaminating their hands or surrogate prosthetic*  
2 *devices, FOOD EMPLOYEES may use disposable paper towels or*  
3 *similar clean barriers when touching surfaces such as*  
4 *manually operated faucet handles on a HANDWASHING SINK or*  
5 *the handle of a restroom door.*
- 6 (D) *If APPROVED and capable of removing the types of soils*  
7 *encountered in the FOOD operations involved, an automatic*  
8 *handwashing facility may be used by FOOD EMPLOYEES to clean*  
9 *their hands or surrogate prosthetic devices.*

10 **2-301.13. Special Handwash Procedures.\***

11 Reserved.

12 **2-301.14 When to Wash.\***

13 FOOD EMPLOYEES shall clean their hands and exposed portions of their  
14 arms as specified under §2-301.12 immediately before engaging in  
15 FOOD preparation including working with exposed FOOD, clean  
16 EQUIPMENT and UTENSILS, and unwrapped SINGLE-SERVICE and SINGLE-  
17 USE ARTICLES and:

- 18 (A) After touching bare human body parts other than clean hands  
19 and clean, exposed portions of arms;
- 20 (B) After using the toilet room;
- 21 (C) After caring for or handling SERVICE ANIMALS or aquatic animals  
22 as specified in ¶ 2-403.11(B);
- 23 (D) Except as specified in ¶ 2-401.11(B), after coughing, sneezing,  
24 using a handkerchief or disposable tissue, using tobacco,  
25 eating, or drinking;
- 26 (E) After handling soiled EQUIPMENT or UTENSILS;
- 27 (F) During FOOD preparation, as often as necessary to remove soil  
28 and contamination and to prevent cross contamination when  
29 changing tasks;
- 30 (G) When switching between working with raw FOOD and working

1 with READY-TO-EAT FOOD;

2 (H) Before donning gloves for working with FOOD; and

3 (I) After engaging in other activities that contaminate the hands.

4 **2-301.15 Where to Wash.**

5 FOOD EMPLOYEES shall clean their hands in a HANDWASHING SINK or  
6 APPROVED automatic handwashing facility and shall not clean their  
7 hands in a sink used for FOOD preparation or WAREWASHING, or in a  
8 service sink or a curbed cleaning facility used for the disposal of mop  
9 water and similar liquid waste.

10 **2-301.16 Hand Antiseptics.**

11 (A) A hand antiseptic used as a topical application, a hand  
12 antiseptic solution used as a hand dip, or a hand antiseptic  
13 soap shall:

14 (1) Comply with one of the following:

15 (a) Be an APPROVED drug that is listed in the FDA  
16 publication **Approved Drug Products with**  
17 **Therapeutic Equivalence Evaluations** as an  
18 APPROVED drug based on safety and  
19 effectiveness; or

20 (b) Have active antimicrobial ingredients that are  
21 listed in the FDA monograph for OTC Health-  
22 Care Antiseptic Drug Products as an antiseptic  
23 handwash, and

24 (2) Comply with one of the following:

25 (a) Have components that are exempted from the  
26 requirement of being listed in federal FOOD  
27 ADDITIVE regulations as specified in 21 CFR  
28 170.39 - Threshold of regulation for substances  
29 used in food-contact articles; or

30 (b) Comply with and be listed in:

- 1 (i) 21 CFR 178 - Indirect Food Additives:
- 2 Adjuvants, Production Aids, and
- 3 Sanitizers as regulated for use as a FOOD
- 4 ADDITIVE with conditions of safe use, or
- 5 (ii) 21 CFR 182 - Substances Generally
- 6 Recognized as Safe, 21 CFR 184 - Direct
- 7 Food Substances Affirmed as Generally
- 8 Recognized as Safe, or 21 CFR 186 -
- 9 Indirect Food Substances Affirmed as
- 10 Generally Recognized as Safe for use in
- 11 contact with food, and;

12 (3) Be applied only to hands that are cleaned as specified  
 13 under § 2-301.12.

14 (B) If a hand antiseptic or a hand antiseptic solution used as a  
 15 hand dip does not meet the criteria specified under  
 16 Subparagraph (A)(2) of this section, use shall be:

17 (1) Followed by thorough hand rinsing in clean water  
 18 before hand contact with FOOD or by the use of gloves;  
 19 or

20 (2) Limited to situations that involve no direct contact  
 21 with FOOD by the bare hands.

22 (C) A hand antiseptic solution used as a hand dip shall be  
 23 maintained clean and at a strength equivalent to at least 100  
 24 MG/L chlorine.

25 ***Fingernails***      **2-302.11 Maintenance.**

26 (A) FOOD EMPLOYEES shall keep their fingernails trimmed, filed,  
 27 and maintained so the edges and surfaces are cleanable and  
 28 not rough.

29 (B) *Unless wearing intact gloves in good repair*, a FOOD EMPLOYEE  
 30 shall not wear fingernail polish or artificial fingernails when

working with exposed FOOD.

**Jewelry 2-303.11 Prohibition.**

Except for *a plain ring such as a wedding band*, while preparing FOOD, FOOD EMPLOYEES shall not wear jewelry including medical information jewelry on their arms and hands.

**Outer Clothing 2-304.11 Clean Condition.**

FOOD EMPLOYEES shall wear clean outer clothing to prevent contamination of FOOD, EQUIPMENT, UTENSILS, LINENS, and SINGLE-SERVICE and SINGLE-USE ARTICLES.

**2-4 HYGIENIC PRACTICES**

**Subparts**

**2-401 Food Contamination Prevention**

**2-402 Hair Restraints**

**2-403 Animals**

**Food 2-401.11 Eating, Drinking, or Using Tobacco.\***

**Contamination Prevention**

(A) Except as specified in ¶ (B) of this section, an EMPLOYEE shall eat, drink, or use any form of tobacco only in designated areas where the contamination of exposed FOOD; clean EQUIPMENT, UTENSILS, and LINENS; unwrapped SINGLE-SERVICE and SINGLE-USE ARTICLES; or other items needing protection can not result.

(B) *A FOOD EMPLOYEE may drink from a closed BEVERAGE container if the container is handled to prevent contamination of:*

- (1) *The EMPLOYEE'S hands;*
- (2) *The container; and*
- (3) *Exposed FOOD; clean EQUIPMENT, UTENSILS, and LINENS; and unwrapped SINGLE-SERVICE and SINGLE-USE ARTICLES.*

**2-401.12 Discharges from the Eyes, Nose, and Mouth.\***

1 FOOD EMPLOYEES experiencing persistent sneezing, coughing, or a  
 2 runny nose that causes discharges from the eyes, nose, or mouth  
 3 shall not work with exposed FOOD; clean EQUIPMENT, UTENSILS, and  
 4 LINENS; or unwrapped SINGLE-SERVICE OR SINGLE-USE ARTICLES.

5 **Hair** **2-402.11 Effectiveness.**

6 **Restraints**

(A) Except as provided in ¶ (B) of this section, FOOD EMPLOYEES  
 7 shall wear hair restraints such as hats, hair coverings or nets,  
 8 beard restraints, and clothing that covers body hair, that are  
 9 designed and worn to effectively keep their hair from  
 10 contacting exposed FOOD; clean EQUIPMENT, UTENSILS, and  
 11 LINENS; and unwrapped SINGLE-SERVICE and SINGLE-USE  
 12 ARTICLES.

(B) *This section does not apply to FOOD EMPLOYEES such as*  
 13 *counter staff who only serve BEVERAGES and wrapped or*  
 14 *PACKAGED FOODS, hostesses, and wait staff if they present a*  
 15 *minimal RISK of contaminating exposed FOOD; clean EQUIPMENT,*  
 16 *UTENSILS, and LINENS; and unwrapped SINGLE-SERVICE and*  
 17 *SINGLE-USE ARTICLES.*

19 **Animals** **2-403.11 Handling Prohibition.\***

(A) Except as specified in ¶ (B) of this section, FOOD EMPLOYEES  
 20 shall not care for or handle animals that may be present such  
 21 as patrol dogs, SERVICE ANIMALS, or pets that are allowed as  
 22 specified in Subparagraphs 6-501.115(B)(2)-(5).

(B) *FOOD EMPLOYEES with SERVICE ANIMALS may handle or care for*  
 23 *their SERVICE ANIMALS and FOOD EMPLOYEES may handle or care*  
 24 *for FISH in aquariums or MOLLUSCAN SHELLFISH or crustacea in*  
 25 *display tanks if they wash their hands as specified under*  
 26 *§ 2-301.12 and ¶ 2-301.14(C).*

22 § 3-601.12, honestly presented.23 **3-2 SOURCES, SPECIFICATIONS, AND ORIGINAL CONTAINERS AND**  
24 **RECORDS**25 *Subparts*26 **3-201 Sources**27 **3-202 Specifications for Receiving**28 **3-203 Original Containers and Records**

- 1
- 2 **Sources**                    **3-201.11 Compliance with Food Law.\***
- 3 (A) FOOD shall be obtained from sources that comply with
- 4 LAW.
- 5 (B) FOOD prepared in a private home shall not be used or
- 6 offered for human consumption in a FOOD ESTABLISHMENT.
- 7 (C) PACKAGED FOOD shall be labeled as specified in LAW,
- 8 including 21 CFR 101 FOOD Labeling, 9 CFR 317
- 9 Labeling, Marking Devices, and Containers, and 9 CFR
- 10 381 Subpart N Labeling and Containers, and as specified
- 11 under §§ 3-202.17 and 3-202.18.
- 12 (D) *Fish, other than MOLLUSCAN SHELLFISH, that are intended for*
- 13 *consumption in their raw form and allowed as specified in*
- 14 *Subparagraph 3-401.11(C)(1) may be offered for sale or*
- 15 *service if they are obtained from a supplier that freezes the*
- 16 *FISH as specified under § 3-402.11; or frozen on the PREMISES*
- 17 *as specified under § 3-402.11 and records are retained as*
- 18 *specified under § 3-402.12.*
- 19 (E) WHOLE-MUSCLE, INTACT BEEF steaks that are intended for
- 20 consumption in an undercooked form without a
- 21 CONSUMER advisory as specified in ¶ 3-401.11(C) shall
- 22 be:
- 23 (1) Obtained from a FOOD PROCESSING PLANT that, upon
- 24 request by the purchaser, packages the steaks and
- 25 labels them, to indicate that the steaks meet the
- 26 definition of WHOLE-MUSCLE, INTACT BEEF, or
- 27 (2) Deemed acceptable by the REGULATORY AUTHORITY
- 28 based on other evidence, such as written buyer
- 29 specifications or invoices, that indicates that the
- 30 steaks meet the definition of WHOLE-MUSCLE, INTACT

- 1 BEEF, and
- 2 (3) If individually cut in a FOOD ESTABLISHMENT:
- 3 (a) Cut from WHOLE-MUSCLE INTACT BEEF that is
- 4 labeled by a FOOD PROCESSING PLANT as
- 5 specified in Subparagraph (E)(1) of this
- 6 section or identified as specified in
- 7 Subparagraph (E)(2) of this section.
- 8 (b) Prepared so they remain intact, and
- 9 (c) If PACKAGED for undercooking in a FOOD
- 10 ESTABLISHMENT, labeled as specified in
- 11 Subparagraph (E)(1) of this section or
- 12 identified as specified in (E)(2) of this
- 13 section.
- 14 (F) MEAT and POULTRY that is not a READY-TO-EAT FOOD and is
- 15 in a PACKAGED form when it is offered for sale or otherwise
- 16 offered for consumption, shall be labeled to include safe
- 17 handling instructions as specified in LAW, including 9 CFR
- 18 317.2(l) and 9 CFR 381.125(b).
- 19 (G) EGGS that have not been specifically treated to destroy
- 20 all viable *Salmonellae* shall be labeled to include safe
- 21 handling instructions as specified in LAW, including 21
- 22 CFR 101.17(h).

23 **3-201.12 Food in a Hermetically Sealed Container.\***

24 FOOD in a HERMETICALLY SEALED CONTAINER shall be obtained from

25 a FOOD PROCESSING PLANT that is regulated by the FOOD regulatory

26 agency that has jurisdiction over the plant.

27 **3-201.13 Fluid Milk and Milk Products.\***

28 Fluid milk and milk products shall be obtained from sources

29 that comply with GRADE A STANDARDS as specified in LAW.

30 **3-201.14 Fish.\***

- 1 (A) FISH that are received for sale or service shall be:
- 2 (1) Commercially and legally caught or harvested; or
- 3 (2) APPROVED for sale or service.
- 4 (B) MOLLUSCAN SHELLFISH that are recreationally caught shall
- 5 not be received for sale or service.

**3-201.15 Molluscan Shellfish.\***

- 7 (A) MOLLUSCAN SHELLFISH shall be obtained from sources
- 8 according to LAW and the requirements specified in the
- 9 U.S. Department of Health and Human Services, Public
- 10 Health Service, Food and Drug Administration, National
- 11 Shellfish Sanitation Program Guide for the Control of
- 12 Molluscan Shellfish.
- 13 (B) MOLLUSCAN SHELLFISH received in interstate commerce shall
- 14 be from sources that are listed in the Interstate Certified
- 15 Shellfish Shippers List.

**3-201.16 Wild Mushrooms.\***

- 17 (A) Except as specified in ¶ (B) of this section, mushroom
- 18 species picked in the wild shall be obtained from sources
- 19 where each mushroom is individually inspected and
- 20 found to be safe by an APPROVED mushroom identification
- 21 expert.
- 22 (B) *This section does not apply to:*
- 23 (1) *Cultivated wild mushroom species that are grown,*
- 24 *harvested, and processed in an operation that is*
- 25 *regulated by the FOOD regulatory agency that has*
- 26 *jurisdiction over the operation; or*
- 27 (2) *Wild mushroom species if they are in packaged*
- 28 *form and are the product of a FOOD PROCESSING*
- 29 *PLANT that is regulated by the FOOD regulatory*
- 30 *agency that has jurisdiction over the plant.*

**3-201.17 Game Animals.\***

(A) If GAME ANIMALS are received for sale or service they shall be:

(1) Commercially raised for FOOD and:

(a) Raised, slaughtered, and processed under a voluntary inspection program that is conducted by the agency that has animal health jurisdiction, or

(b) Under a routine inspection program conducted by a regulatory agency other than the agency that has animal health jurisdiction, and

(c) Raised, slaughtered, and processed according to:

(i) LAWS governing MEAT and POULTRY as determined by the agency that has animal health jurisdiction and the agency that conducts the inspection program, and

(ii) Requirements which are developed by the agency that has animal health jurisdiction and the agency that conducts the inspection program with consideration of factors such as the need for antemortem and postmortem examination by an APPROVED veterinarian or veterinarian's designee;

(2) Under a voluntary inspection program administered by the USDA for game animals such as exotic animals (reindeer, elk, deer, antelope, water

1 buffalo, or bison) that are “inspected and  
2 APPROVED” in accordance with 9 CFR 352 Exotic  
3 animals; voluntary inspection of rabbits that are  
4 “inspected and certified” in accordance with 9 CFR  
5 354 voluntary inspection of rabbits and edible  
6 products thereof;

7 (3) As allowed by LAW, for wild GAME ANIMALS that are  
8 live-caught:

9 (a) Under a routine inspection program  
10 conducted by a regulatory agency such as  
11 the agency that has animal health  
12 jurisdiction, and

13 (b) Slaughtered and processed according to:

14 (i) LAWS governing MEAT and POULTRY as  
15 determined by the agency that has  
16 animal health jurisdiction and the  
17 agency that conducts the inspection  
18 program, and

19 (ii) Requirements which are developed by  
20 the agency that has animal health  
21 jurisdiction and the agency that  
22 conducts the inspection program with  
23 consideration of factors such as the  
24 need for antemortem and postmortem  
25 examination by an APPROVED  
26 veterinarian or veterinarian’s designee;  
27 or

28 (4) As allowed by LAW, for field-dressed wild GAME  
29 ANIMALS under a routine inspection program that  
30 ensures the animals:

- 1 (a) Receive a postmortem examination by an
- 2 APPROVED veterinarian or veterinarian's
- 3 designee, or
- 4 (b) Are field-dressed and transported according
- 5 to requirements specified by the agency
- 6 that has animal health jurisdiction and the
- 7 agency that conducts the inspection
- 8 program, and
- 9 (c) Are processed according to LAWS governing
- 10 MEAT and POULTRY as determined by the agency
- 11 that has animal health jurisdiction and the
- 12 agency that conducts the inspection program.

13 (B) A GAME ANIMAL shall not be received for sale or service if  
 14 it is a species of wildlife that is listed in 50 CFR 17  
 15 Endangered and threatened wildlife and plants.

16 **Specifications 3-202.11 Temperature.\***

- 17 **for Receiving**
- 18 (A) Except as specified in ¶ (B) of this section, refrigerated,
  - 19 POTENTIALLY HAZARDOUS FOOD (TIME/TEMPERATURE CONTROL FOR
  - 20 SAFETY FOOD) shall be at a temperature of 5°C (41°F) or
  - 21 below when received.
  - 22 (B) *If a temperature other than 5°C (41°F) for a POTENTIALLY*
  - 23 *HAZARDOUS FOOD (TIME/TEMPERATURE CONTROL FOR SAFETY FOOD)*
  - 24 *is specified in LAW governing its distribution, such as LAWS*
  - 25 *governing milk and MOLLUSCAN SHELLFISH, the FOOD may be*
  - 26 *received at the specified temperature.*
  - 27 (C) Raw EGGS shall be received in refrigerated equipment that
  - 28 maintains an ambient air temperature of 7°C (45°F) or
  - 29 less.
  - 30 (D) POTENTIALLY HAZARDOUS FOOD (TIME/TEMPERATURE CONTROL FOR
  - SAFETY FOOD) that is cooked to a temperature and for a

1 time specified under §§ 3-401.11 - 3-401.13 and received  
2 hot shall be at a temperature of 57°C (135°F) or above.

3  
4 (E) A FOOD that is labeled frozen and shipped frozen by a  
5 FOOD PROCESSING PLANT shall be received frozen.

6 (F) Upon receipt, POTENTIALLY HAZARDOUS FOOD (TIME/TEMPERATURE  
7 CONTROL FOR SAFETY FOOD) shall be free of evidence of  
8 previous temperature abuse.

9 **3-202.12 Additives.\***

10 FOOD shall not contain UNAPPROVED FOOD ADDITIVES or ADDITIVES  
11 that exceed amounts specified in 21 CFR 170-180 relating to FOOD  
12 ADDITIVES, generally recognized as safe or prior sanctioned  
13 substances that exceed amounts specified in 21 CFR 181-186,  
14 substances that exceed amounts specified in 9 CFR Subpart C  
15 Section 424.21(b). Food ingredients and sources of radiation, or  
16 pesticide residues that exceed provisions specified in 40 CFR 180  
17 Tolerances for pesticides chemicals in food, and exceptions.

18 **3-202.13 Eggs.\***

19 EGGS shall be received clean and sound and shall not  
20 exceed the restricted EGG tolerances for U.S. Consumer Grade  
21 B as specified in United States Standards, Grades, and Weight  
22 Classes for Shell Eggs, AMS 56.200 *et seq.*, administered by  
23 the Agricultural Marketing Service of USDA.

24 **3-202.14 Eggs and Milk Products, Pasteurized.\***

25 (A) EGG PRODUCTS shall be obtained pasteurized.

26 (B) Fluid and dry milk and milk products shall:

27 (1) Be obtained pasteurized; and

28 (2) Comply with GRADE A STANDARDS as specified in LAW.

29  
30 (C) Frozen milk products, such as ice cream, shall be

1 obtained pasteurized as specified in 21 CFR 135 –  
2 Frozen desserts.

- 3 (D) Cheese shall be obtained pasteurized *unless alternative*  
4 *procedures to pasteurization are specified in the CFR,*  
5 *such as 21 CFR 133 - Cheeses and related cheese*  
6 *products, for curing certain cheese varieties.*

7 **3-202.15 Package Integrity.\***

8 FOOD packages shall be in good condition and protect the  
9 integrity of the contents so that the FOOD is not exposed to  
10 ADULTERATION or potential contaminants.

11 **3-202.16 Ice.\***

12 Ice for use as a FOOD or a cooling medium shall be made from  
13 DRINKING WATER.

14 **3-202.17 Shucked Shellfish, Packaging and**  
15 **Identification.**

- 16 (A) Raw SHUCKED SHELLFISH shall be obtained in nonreturnable  
17 packages which bear a legible label that identifies the:

18 (1) Name, address, and CERTIFICATION NUMBER of the  
19 shucker-packer or repacker of the MOLLUSCAN  
20 SHELLFISH; and

21 (2) The “sell by” or “best if used by” date for  
22 packages with a capacity of less than 1.89 L  
23 (one-half gallon) or the date shucked for  
24 packages with a capacity of 1.89 L (one-half  
25 gallon) or more.

- 26 (B) A package of raw SHUCKED SHELLFISH that does not bear  
27 a label or which bears a label which does not contain all  
28 the information as specified under ¶ (A) of this section  
29 shall be subject to a hold order, as allowed by LAW, or  
30 seizure and destruction in accordance with 21 CFR

Subpart D - Specific Administrative Decisions Regarding  
Interstate Shipments, Section 1240.60(d) Molluscan shellfish.

**3-202.18 Shellstock Identification.\***

(A) SHELLSTOCK shall be obtained in containers bearing legible source identification tags or labels that are affixed by the harvester or DEALER that depurates, ships, or reships the SHELLSTOCK, as specified in the National Shellfish Sanitation Program Guide for the Control of Molluscan Shellfish, and that list:

(1) Except as specified under ¶(C) of this section, on the harvester's tag or label, the following information in the following order:

(a) The harvester's identification number that is assigned by the SHELLFISH CONTROL AUTHORITY,

(b) The date of harvesting,

(c) The most precise identification of the harvest location or aquaculture site that is practicable based on the system of harvest area designations that is in use by the SHELLFISH CONTROL AUTHORITY and including the abbreviation of the name of the state or country in which the shellfish are harvested,

(d) The type and quantity of shellfish, and

(e) The following statement in bold, capitalized type: "This tag is required to be attached until container is empty or retagged and thereafter kept on file for 90 days;" and

(2) Except as specified in ¶(D) of this section, on each DEALER's tag or label, the following

1 information in the following order:

2 (a) The DEALER's name and address, and the  
3 CERTIFICATION NUMBER assigned by the  
4 SHELLFISH CONTROL AUTHORITY,

5 (b) The original shipper's CERTIFICATION NUMBER  
6 including the abbreviation of the name of  
7 the state or country in which the shellfish  
8 are harvested,

9 (c) The same information as specified for a  
10 harvester's tag under Subparagraphs  
11 (A)(1)(b)-(d) of this section, and

12 (d) The following statement in bold, capitalized  
13 type: "This tag is required to be attached  
14 until container is empty and thereafter kept  
15 on file for 90 days."

16 (B) A container of SHELLSTOCK that does not bear a tag or  
17 label or that bears a tag or label that does not contain  
18 all the information as specified under ¶ (A) of this  
19 section shall be subject to a hold order, as allowed by  
20 LAW, or seizure and destruction in accordance with  
21 21 CFR Subpart D - Specific Administrative Decisions  
22 Regarding Interstate Shipments, Section 1240.60(d).

23 (C) If a place is provided on the harvester's tag or label for  
24 a DEALER's name, address, and CERTIFICATION NUMBER, the  
25 DEALER's information shall be listed first.

26 (D) *If the harvester's tag or label is designed to*  
27 *accommodate each DEALER's identification as specified*  
28 *under Subparagraphs (A)(2)(a) and (b) of this section,*  
29 *individual DEALER tags or labels need not be provided.*

30 **3-202.19 Shellstock, Condition.**

1 When received by a FOOD ESTABLISHMENT, SHELLSTOCK shall be  
2 reasonably free of mud, dead shellfish, and shellfish with  
3 broken shells. Dead shellfish or SHELLSTOCK with badly broken  
4 shells shall be discarded.

5 **3-202.110 Juice Treated.**

6 **Commercially** Pre-PACKAGED JUICE shall:

7 **Processed**

- 8 (A) Be obtained from a processor with a HACCP system as
- 9 specified in 21 CFR Part 120 Hazard Analysis and
- 10 Critical Control (HACCP) Systems; and
- 11 (B) Be obtained pasteurized or otherwise treated to attain a
- 12 5-log reduction of the most resistant microorganism of
- 13 public health significance as specified in 21 CFR Part
- 14 120.24 Process Controls.

14 **3-203.11 Molluscan Shellfish, Original Container.**

15 (A) Except as specified in ¶¶ (B) - (D) of this section,  
16 MOLLUSCAN SHELLFISH shall not be removed from the container  
17 in which they are received other than immediately before  
18 sale or preparation for service.

19 **Original**  
20 **Containers and**  
21 **Records**

- 22 (B) *For display purposes, SHELLSTOCK may be removed from*
- 23 *the container in which they are received, displayed on*
- 24 *drained ice, or held in a display container, and a*
- 25 *quantity specified by a CONSUMER may be removed from*
- 26 *the display or display container and provided to the*
- 27 *CONSUMER if:*
  - 28 (1) *The source of the SHELLSTOCK on display is*
  - 29 *identified as specified under § 3-202.18 and*
  - 30 *recorded as specified under § 3-203.12; and*
  - (2) *The SHELLSTOCK are protected from contamination.*
- (C) *SHUCKED SHELLFISH may be removed from the container in*  
*which they were received and held in a display container*

1 from which individual servings are dispensed upon a  
2 CONSUMER'S request if:

3 (1) The labeling information for the shellfish on display  
4 as specified under § 3-202.17 is retained and  
5 correlated to the date when, or dates during which,  
6 the shellfish are sold or

7 (2) The shellfish are protected from contamination.

8 (D) SHUCKED SHELLFISH may be removed from the container in  
9 which they were received and repacked in CONSUMER self  
10 service containers where allowed by LAW if:

11 (1) The labeling information for the shellfish is on  
12 each CONSUMER self service container as specified  
13 under § 3-202.17 and ¶¶ 3-602.11(A) and (B)(1) -  
14 (5);

15 (2) The labeling information as specified under  
16 § 3-202.17 is retained and correlated with the date  
17 when, or dates during which, the shellfish are  
18 sold or served;

19 (3) The labeling information and dates specified under  
20 Subparagraph (D)(2) of this section are  
21 maintained for 90 days; and

22 (4) The shellfish are protected from contamination.

23 **3-203.12 Shellstock, Maintaining Identification.\***

24 (A) Except as specified under Subparagraph (C) (2) of this  
25 section, SHELLSTOCK tags or labels shall remain attached  
26 to the container in which the SHELLSTOCK are received  
27 until the container is empty.

28 (B) The date when the last SHELLSTOCK from the container is  
29 sold or served shall be recorded on the tag or label.

30 (C) The identity of the source of SHELLSTOCK that are sold

1 or served shall be maintained by retaining SHELLSTOCK  
2 tags or labels for 90 calendar days from the date that  
3 is recorded on the tag or label, as specified under ¶ B  
4 of this section, by:

5 (1) Using an APPROVED record keeping system that  
6 keeps the tags or labels in chronological order  
7 correlated to the date that is recorded on the tag  
8 or label, as specified under ¶ B of this section;  
9 and

10 (2) If SHELLSTOCK are removed from its tagged or labeled  
11 container:

12 (a) Preserving source identification by using a  
13 record keeping system as specified under  
14 Subparagraph (C)(1) of this section, and

15 (b) Ensuring that SHELLSTOCK from one tagged or  
16 labeled container are not COMMINGLED with  
17 SHELLSTOCK from another container with  
18 different CERTIFICATION NUMBERS; different  
19 harvest dates; or different growing areas as  
20 identified on the tag or label before being  
21 ordered by the CONSUMER.

**3-301.12 Preventing Contamination When Tasting.\***

A FOOD EMPLOYEE shall not use a UTENSIL more than once to taste FOOD that is to be sold or served.

**Preventing Food and Ingredient Contamination 3-302.11 Packaged and Unpackaged Food - Separation, Packaging, and Segregation.\***

(A) FOOD shall be protected from cross contamination by:

(1) Separating raw animal FOODS during storage, preparation, holding, and display from:

(a) Raw READY-TO-EAT FOOD including other raw animal FOOD such as FISH for sushi or MOLLUSCAN SHELLFISH, or other raw READY-TO-EAT FOOD such as fruits and vegetables, and

(b) Cooked READY-TO-EAT FOOD;

(2) *Except when combined as ingredients*, separating types of raw animal FOODS from each other such as beef, FISH, lamb, pork, and POULTRY during storage, preparation, holding, and display by:

(a) Using separate EQUIPMENT for each type, or

(b) Arranging each type of FOOD in EQUIPMENT so that cross contamination of one type with another is prevented, and

- 1 (c) Preparing each type of FOOD at different  
2 times or in separate areas;
- 3 (3) Cleaning EQUIPMENT and UTENSILS as specified  
4 under ¶ 4-602.11(A ) and SANITIZING as specified  
5 under § 4-703.11;
- 6 (4) Except as specified under Subparagraph 3  
7 -501.15(B)(2) and in ¶ (B) of this section, storing  
8 the FOOD in packages, covered containers, or  
9 wrappings;
- 10 (5) Cleaning HERMETICALLY SEALED CONTAINERS of FOOD of  
11 visible soil before opening;
- 12 (6) Protecting FOOD containers that are received  
13 packaged together in a case or overwrap from  
14 cuts when the case or overwrap is opened;
- 15 (7) Storing damaged, spoiled, or recalled FOOD being  
16 held in the FOOD ESTABLISHMENT as specified under  
17 § 6-404.11; and
- 18 (8) Separating fruits and vegetables, before they  
19 are washed as specified under § 3-302.15  
20 from READY-TO-EAT FOOD.
- 21 (B) *Subparagraph (A)(4) of this section does not apply to:*
- 22 (1) *Whole, uncut, raw fruits and vegetables and nuts*  
23 *in the shell, that require peeling or hulling before*  
24 *consumption;*
- 25 (2) *PRIMAL CUTS, quarters, or sides of raw MEAT or*  
26 *slab bacon that are hung on clean, SANITIZED hooks*  
27 *or placed on clean, SANITIZED racks;*
- 28 (3) *Whole, uncut, processed MEATS such as country*  
29 *hams, and smoked or cured sausages that are*  
30 *placed on clean, SANITIZED racks;*

1 (4) *FOOD being cooled as specified under*  
 2 *Subparagraph 3-501.15(B)(2); or*

3 (5) *SHELLSTOCK.*

4 **3-302.12 Food Storage Containers, Identified with Common**  
 5 **Name of Food.**

6 *Except for containers holding FOOD that can be readily and*  
 7 *unmistakably recognized such as dry pasta, working containers*  
 8 *holding FOOD or FOOD ingredients that are removed from their*  
 9 *original packages for use in the FOOD ESTABLISHMENT, such as*  
 10 *cooking oils, flour, herbs, potato flakes, salt, spices, and sugar*  
 11 *shall be identified with the common name of the FOOD.*

12 **3-302.13 Pasteurized Eggs, Substitute for Raw Eggs for**  
 13 **Certain Recipes.\***

14 Pasteurized EGGS or EGG PRODUCTS shall be substituted for  
 15 raw EGGS in the preparation of FOODS such as Caesar salad,  
 16 hollandaise or Béarnaise sauce, mayonnaise, meringue,  
 17 eggnog, ice cream, and EGG-fortified BEVERAGES that are  
 18 not:

19 (A) Cooked as specified under Subparagraphs  
 20 3-401.11(A)(1) or (2); or

21 (B) Included in ¶ 3-401.11(D).

22 **3-302.14 Protection from Unapproved Additives.\***

23 (A) FOOD shall be protected from contamination that may  
 24 result from the addition of, as specified in § 3-202.12:

25 (1) Unsafe or unAPPROVED FOOD or COLOR ADDITIVES;  
 26 and

27 (2) Unsafe or unapproved levels of APPROVED FOOD and  
 28 COLOR ADDITIVES.

29 (B) A FOOD EMPLOYEE may not:

30 (1) Apply sulfiting agents to fresh fruits and vegetables

intended for raw consumption or to a FOOD considered to be a good source of vitamin B<sub>1</sub>; or

(2) *Except for grapes*, serve or sell FOOD specified under Subparagraph (B)(1) of this section that is treated with sulfiting agents before receipt by the FOOD ESTABLISHMENT.

**3-302.15 Washing Fruits and Vegetables.**

(A) *Except as specified in ¶ (B) of this section and except for whole, raw fruits and vegetables that are intended for washing by the CONSUMER before consumption*, raw fruits and vegetables shall be thoroughly washed in water to remove soil and other contaminants before being cut, combined with other ingredients, cooked, served, or offered for human consumption in READY-TO-EAT form.

(B) *Fruits and vegetables may be washed by using chemicals as specified under § 7-204.12.*

**Preventing Contamination from Ice Used as a Coolant**

**3-303.11 Ice Used as Exterior Coolant, Prohibited as Ingredient.**

After use as a medium for cooling the exterior surfaces of FOOD such as melons or FISH, PACKAGED FOODS such as canned BEVERAGES, or cooling coils and tubes of EQUIPMENT, ice shall not be used as FOOD.

**3-303.12 Storage or Display of Food in Contact with Water or Ice.**

(A) PACKAGED FOOD shall not be stored in direct contact with ice or water if the FOOD is subject to the entry of water because of the nature of its packaging, wrapping, or container or its positioning in the ice or water.

(B) Except as specified in ¶¶ (C) and (D) of this section, UNPACKAGED FOOD shall not be stored in direct contact

1 with undrained ice.

2 (C) *Whole, raw fruits or vegetables; cut, raw vegetables such*  
 3 *as celery or carrot sticks or cut potatoes; and tofu may*  
 4 *be immersed in ice or water.*

5 (D) *Raw poultry and raw FISH that are received immersed in*  
 6 *ice in shipping containers may remain in that condition*  
 7 *while in storage awaiting preparation, display, service, or*  
 8 *sale.*

9 **Preventing 3-304.11 Food Contact with Equipment and Utensils.\***

10 **Contamination** FOOD shall only contact surfaces of:

11 **from Equipment,** (A) EQUIPMENT and UTENSILS that are cleaned as specified  
 12 **Utensils, and** under Part 4-6 of this Code and SANITIZED as specified  
 13 **Linens** under Part 4-7 of this Code; or

14 (B) SINGLE-SERVICE and SINGLE-USE ARTICLES.

15 **3-304.12 In-Use Utensils, Between -Use Storage.**

16 During pauses in FOOD preparation or dispensing, FOOD  
 17 preparation and dispensing UTENSILS shall be stored:

18 (A) Except as specified under ¶ (B) of this section, in the  
 19 FOOD with their handles above the top of the FOOD and  
 20 the container;

21 (B) In FOOD that is not POTENTIALLY HAZARDOUS ( TIME/TEMPERATURE  
 22 CONTROL FOR SAFETY FOOD) with their handles above the top  
 23 of the FOOD within containers or EQUIPMENT that can be  
 24 closed, such as bins of sugar, flour, or cinnamon;

25 (C) On a clean portion of the FOOD preparation table or  
 26 cooking EQUIPMENT only if the in-use UTENSIL and the  
 27 FOOD-CONTACT surface of the FOOD preparation table or cooking  
 28 EQUIPMENT are cleaned and SANITIZED at a frequency  
 29 specified under §§ 4-602.11 and 4-702.11;

30 (D) In running water of sufficient velocity to flush

1 particulates to the drain, if used with moist FOOD such  
2 as ice cream or mashed potatoes;

3 (E) In a clean, protected location if the UTENSILS, such as  
4 ice scoops, are used only with a FOOD that is not  
5 POTENTIALLY HAZARDOUS (TIME/TEMPERATURE CONTROL FOR SAFETY  
6 FOOD); or

7 (F) In a container of water if the water is maintained at a  
8 temperature of at least 60°C (140°F) and the container is  
9 cleaned at a frequency specified under Subparagraph 4-  
10 602.11(D)(7).

11 **3-304.13 Linens and Napkins, Use Limitation.**

12 LINENS and napkins shall not be used in contact with FOOD  
13 *unless they are used to line a container for the service of*  
14 *FOODS and the LINENS and napkins are replaced each time the*  
15 *container is refilled for a new CONSUMER.*

16 **3-304.14 Wiping Cloths, Use Limitation.**

17 (A) Cloths in-use for wiping FOOD spills from TABLEWARE and  
18 carry-out containers that occur as FOOD is being served  
19 shall be:

- 20 (1) Maintained dry; and
- 21 (2) Used for no other purpose.

22 (B) Cloths in-use for wiping counters and other EQUIPMENT  
23 surfaces shall be:

- 24 (1) Held between uses in a chemical sanitizer solution  
25 at a concentration specified under § 4-501.114;  
26 and
- 27 (2) Laundered daily as specified under ¶ 4-802.11(D).

28 (C) Cloths in-use for wiping surfaces in contact with raw  
29 animal FOODS shall be kept separate from cloths used for  
30 other purposes.

- 1 (D) Dry wiping cloths and the chemical sanitizing solutions  
2 specified in Subparagraph (B)(1) of this section in which  
3 wet wiping cloths are held between uses shall be free  
4 of FOOD debris and visible soil.
- 5 (E) Containers of chemical sanitizing solutions specified in  
6 Subparagraph (B)(1) of this section in which wet wiping  
7 cloths are held between uses shall be stored off the  
8 floor and used in a manner that prevents contamination  
9 of FOOD, EQUIPMENT, UTENSILS, LINENS, SINGLE-SERVICE, OR  
10 SINGLE-USE ARTICLES.
- 11 (F) SINGLE-USE disposable sanitizer wipes shall be used in  
12 accordance with EPA-approved manufacturer's label use  
13 instructions.

14 **3-304.15 Gloves, Use Limitation.**

- 15 (A) If used, SINGLE-USE gloves shall be used for only one  
16 task such as working with READY-TO-EAT FOOD or with  
17 raw animal FOOD, used for no other purpose, and  
18 discarded when damaged or soiled, or when  
19 interruptions occur in the operation.
- 20 (B) Except as specified in ¶ (C) of this section, slash-resistant  
21 gloves that are used to protect the hands during  
22 operations requiring cutting shall be used in direct  
23 contact only with FOOD that is subsequently cooked as  
24 specified under Part 3-4 such as frozen FOOD or a  
25 PRIMAL CUT of MEAT.
- 26 (C) *Slash-resistant gloves may be used with READY-TO-EAT FOOD*  
27 *that will not be subsequently cooked if the slash-resistant*  
28 *gloves have a SMOOTH, durable, and nonabsorbent outer*  
29 *surface; or if the slash-resistant gloves are covered with*  
30 *a SMOOTH, durable, nonabsorbent glove, or a SINGLE-USE*

1                   *glove.*

- 2                   (D) Cloth gloves shall not be used in direct contact with  
3                   FOOD *unless the FOOD is subsequently cooked as*  
4                   *required under Part 3-4 such as frozen FOOD or a PRIMAL*  
5                   *CUT of MEAT.*

6                   **3-304.16     Using Clean Tableware for Second Portions and**  
7                   **Refills.**

- 8                   (A) Except for refilling a CONSUMER'S drinking cup or  
9                   container without contact between the pouring UTENSIL  
10                  and the lip-contact area of the drinking cup or  
11                  container, FOOD EMPLOYEES shall not use TABLEWARE,  
12                  including SINGLE-SERVICE ARTICLES, soiled by the CONSUMER,  
13                  to provide second portions or refills.

- 14                  (B) Except as specified in ¶ (C) of this section, self-service  
15                  CONSUMERS shall not be allowed to use soiled  
16                  TABLEWARE, including SINGLE-SERVICE ARTICLES, to obtain  
17                  additional FOOD from the display and serving  
18                  EQUIPMENT.

- 19                  (C) *Drinking cups and containers may be reused by self-*  
20                  *service CONSUMERS if refilling is a contamination-free*  
21                  *process as specified under §§ 4-204.13(A), (B), and (D).*

22                  **3-304.17     Refilling Returnables.**

- 23                  (A) A take-home FOOD container returned to a FOOD ESTABLISHMENT  
24                  shall not be refilled at a FOOD ESTABLISHMENT with a  
25                  POTENTIALLY HAZARDOUS FOOD (TIME/TEMPERATURE CONTROL FOR  
26                  SAFETY FOOD).

- 27                  (B) Except as specified in ¶ (C), a take-home FOOD container  
28                  refilled with FOOD that is not POTENTIALLY HAZARDOUS  
29                  (TIME/TEMPERATURE CONTROL FOR SAFETY FOOD) shall be  
30                  cleaned as specified under ¶ 4-603.17(B).

1 (C) *Personal take-out BEVERAGE containers, such as*  
 2 *thermally insulated bottles, nonspill coffee cups, and*  
 3 *promotional BEVERAGE glasses, may be refilled by EMPLOYEES*  
 4 *or the CONSUMER if refilling is a contamination-free*  
 5 *process as specified under §§ 4-204.13(A), (B), and (D).*

6 **Preventing 3-305.11 Food Storage.**

7 **Contamination**  
 8 **from the**  
 9 **Premises**

(A) Except as specified in §§ (B) and (C) of this section, FOOD shall be protected from contamination by storing the FOOD:

- (1) In a clean, dry location;
- (2) Where it is not exposed to splash, dust, or other contamination; and
- (3) At least 15 cm (6 inches) above the floor.

(B) *FOOD in packages and working containers may be stored less than 15 cm (6 inches) above the floor on case lot handling EQUIPMENT as specified under § 4-204.122.*

(C) *Pressurized BEVERAGE containers, cased FOOD in waterproof containers such as bottles or cans, and milk containers in plastic crates may be stored on a floor that is clean and not exposed to floor moisture.*

20 **3-305.12 Food Storage, Prohibited Areas.**

21 FOOD shall not be stored:

- 22 (A) In locker rooms;
- 23 (B) In toilet rooms;
- 24 (C) In dressing rooms;
- 25 (D) In garbage rooms;
- 26 (E) In mechanical rooms;
- 27 (F) Under sewer lines that are not shielded to
- 28 intercept potential drips;
- 29 (G) Under leaking water lines, including leaking
- 30 automatic fire sprinkler heads, or under lines on

which water has condensed;

(H) Under open stairwells; or

(I) Under other sources of contamination.

**3-305.13 Vended Potentially Hazardous Food (Time/Temperature Control for Safety Food), Original Container**

POTENTIALLY HAZARDOUS FOOD (TIME/TEMPERATURE CONTROL FOR SAFETY FOOD) dispensed through a VENDING MACHINE shall be in the PACKAGE in which it was placed at the FOOD ESTABLISHMENT or FOOD PROCESSING PLANT at which it was prepared.

**3-305.14 Food Preparation.**

During preparation, UNPACKAGED FOOD shall be protected from environmental sources of contamination.

**Preventing Contamination by Consumers**

**3-306.11 Food Display.**

*Except for nuts in the shell and whole, raw fruits and vegetables that are intended for hulling, peeling, or washing by the CONSUMER before consumption,* FOOD on display shall be protected from contamination by the use of PACKAGING; counter, service line, or salad bar FOOD guards; display cases; or other effective means.

**3-306.12 Condiments, Protection.**

(A) Condiments shall be protected from contamination by being kept in dispensers that are designed to provide protection, protected FOOD displays provided with the proper UTENSILS, original containers designed for dispensing, or individual PACKAGES or portions.

(B) Condiments at a VENDING MACHINE LOCATION shall be in individual PACKAGES or provided in dispensers that are filled at an APPROVED location, such as the FOOD ESTABLISHMENT that provides FOOD to the VENDING MACHINE LOCATION, a

1 FOOD PROCESSING PLANT that is regulated by the agency  
 2 that has jurisdiction over the operation, or a properly  
 3 equipped facility that is located on the site of the  
 4 VENDING MACHINE LOCATION.

5 **3-306.13 Consumer Self-Service Operations.\***

6 (A) Raw, UNPACKAGED animal FOOD, such as beef, lamb, pork,  
 7 POULTRY, and FISH shall not be offered for CONSUMER  
 8 self-service. *This paragraph does not apply to:*

9 (1) *CONSUMER self-service of READY-TO-EAT FOODS at buffets*  
 10 *or salad bars that serve FOODS such as sushi or*  
 11 *raw shellfish;*

12 (2) *Ready-to-cook individual portions for immediate*  
 13 *cooking and consumption on the PREMISES such*  
 14 *as CONSUMER-cooked MEATS or CONSUMER-selected*  
 15 *ingredients for Mongolian barbecue; or*

16 (3) *Raw, frozen, shell-on shrimp, or lobster.*

17 (B) CONSUMER self-service operations for READY-TO-EAT FOODS  
 18 shall be provided with suitable UTENSILS or effective  
 19 dispensing methods that protect the FOOD from  
 20 contamination.<sup>N</sup>

21 (C) CONSUMER self-service operations such as buffets and  
 22 salad bars shall be monitored by FOOD EMPLOYEES  
 23 trained in safe operating procedures.<sup>N</sup>

24 **3-306.14 Returned Food and Re-Service of Food.\***

25 (A) Except as specified in ¶ (B) of this section, after being  
 26 served or sold and in the possession of a CONSUMER,  
 27 FOOD that is unused or returned by the CONSUMER shall  
 28 not be offered as FOOD for human consumption.

29 (B) Except as specified under ¶ 3-801.11(G), *a container of*  
 30 *FOOD that is not POTENTIALLY HAZARDOUS (TIME/TEMPERATURE*

1 CONTROL FOR SAFETY FOOD) may be RE-SERVED from one  
2 CONSUMER to another if:

3 (1) The FOOD is dispensed so that it is protected from  
4 contamination and the container is closed  
5 between uses, such as a narrow-neck bottle  
6 containing catsup, steak sauce, or wine; or

7 (2) The FOOD, such as crackers, salt, or pepper, is  
8 in an unopened original PACKAGE and is  
9 maintained in sound condition.

10 **Preventing 3-307.11 Miscellaneous Sources of Contamination.**

11 **Contamination** FOOD shall be protected from contamination that may result  
12 **from Other** from a factor or source not specified under Subparts 3-301 -  
13 **Sources** 3-306.

22 **Cooking 3-401.11 Raw Animal Foods.\***

23 (A) Except as specified under ¶¶ (B) and in ¶¶¶ (C) and (D) of  
24 this section, raw animal FOODS such as EGGS, FISH,  
25 MEAT, POULTRY, and FOODS containing these raw animal  
26 FOODS, shall be cooked to heat all parts of the FOOD to  
27 a temperature and for a time that complies with one of  
28 the following methods based on the FOOD that is being  
29 cooked:

- 30 (1) 63°C (145°F) or above for 15 seconds for:

- 1 (a) Raw EGGS that are broken and prepared in
- 2 response to a CONSUMER'S order and for
- 3 immediate service, and
- 4 (b) Except as specified under Subparagraphs
- 5 (A)(2) and (A)(3) and ¶ (B), and in ¶ (C) of
- 6 this section, FISH and MEAT including GAME
- 7 ANIMALS commercially raised for FOOD as
- 8 specified under Subparagraph 3-201.17(A)(1)
- 9 and GAME ANIMALS under a voluntary
- 10 inspection program as specified under
- 11 Subparagraph 3-201.17(A)(2);
- 12 (2) 68°C (155°F) for 15 seconds or the temperature
- 13 specified in the following chart that corresponds to
- 14 the holding time for RATITES and INJECTED MEATS; the
- 15 following if they are COMMINUTED: FISH, MEAT, GAME
- 16 ANIMALS commercially raised for FOOD as specified
- 17 under Subparagraph 3-201.17(A)(1), and GAME
- 18 ANIMALS under a voluntary inspection program as
- 19 specified under Subparagraph 3-201.17(A)(2); and
- 20 raw EGGS that are not prepared as specified under
- 21 Subparagraph (A)(1)(a) of this section:

**Minimum**

<b>Temperature</b>	<b>Time</b>
°C (°F)	
63 (145)	3 minutes
66 (150)	1 minute
70 (158)	< 1 second (instantaneous)

;or

- 29 (3) 74°C (165°F) or above for 15 seconds for POULTRY, BALUTS, wild
- 30 GAME ANIMALS as specified under Subparagraphs 3-201.17(A)(3)

1 and (4), stuffed FISH, stuffed MEAT, stuffed pasta, stuffed  
 2 POULTRY, stuffed RATITES, or stuffing containing FISH, MEAT,  
 3 POULTRY, OR RATITES.

4 (B) Whole MEAT roasts including beef, corned beef, lamb, pork, and cured  
 5 pork roasts such as ham shall be cooked:

6 (1) In an oven that is preheated to the temperature specified for  
 7 the roast's weight in the following chart and that is held at that  
 8 temperature:

9 Oven Type	10 Oven Temperature Based on Roast Weight	
	11 Less than 4.5 kg (10 lbs)	12 4.5 kg (10 lbs) or More
13 Still Dry	177°C (350°F) or more	121°C (250°F) or more
14 Convection	163°C (325°F) or more	121°C (250°F) or more
15 High Humidity <sup>1</sup>	121°C (250°F) or less	121°C (250°F) or less

16 <sup>1</sup> Relative humidity greater than 90% for at least 1 hour as measured in the cooking chamber or  
 17 exit of the oven; or in a moisture-impermeable bag that provides 100% humidity.

18 ;and

19 (2) As specified in the following chart, to heat all parts of the FOOD  
 20 to a temperature and for the holding time that corresponds to  
 21 that temperature:

22 Temperature	23 Time <sup>1</sup> in	24 Temperature	25 Time <sup>1</sup> in
26 °C (°F)	27 Minutes	28 °C (°F)	29 Seconds
54.4 (130)	112	63.9(147)	134
55.0 (131)	89	65.0 (149)	85
56.1 (133)	56	66.1 (151)	54
57.2 (135)	36	67.2(153)	34
57.8 (136)	28	68.3(155)	22
58.9 (138)	18	69.4 (157)	14
60.0 (140)	12	70.0 (158)	0
61.1 (142)	8		

1           62.2 (144)           5

2           62.8 (145)           4

3           <sup>1</sup>Holding time may include postoven heat rise.

4           (C)    A raw or undercooked WHOLE-MUSCLE, INTACT BEEF steak may be  
5           served or offered for sale in a READY-TO-EAT form if:

6           (1)    The FOOD ESTABLISHMENT serves a population that is not a  
7           HIGHLY SUSCEPTIBLE POPULATION,

8           (2)    The steak is labeled to indicate that it meets the definition of  
9           “WHOLE-MUSCLE, INTACT BEEF” as specified under ¶ 3-201.11(E),  
10           and

11           (3)   The steak is cooked on both the top and bottom to a surface  
12           temperature of 63°C (145°F) or above and a cooked color  
13           change is achieved on all external surfaces.

14           (D)   A raw animal FOOD such as raw EGG, raw FISH, raw-  
15           marinated FISH, raw MOLLUSCAN SHELLFISH, or steak tartare;  
16           or a partially cooked FOOD such as lightly cooked FISH,  
17           soft cooked EGGS, or rare MEAT other than WHOLE-  
18           MUSCLE, INTACT BEEF steaks as specified in ¶ (C) of this  
19           section, may be served or offered for sale upon CONSUMER  
20           request or selection in a READY-TO-EAT form if:

21           (1)    As specified under ¶¶ 3-801.11(C)(1) and (2), the  
22           FOOD ESTABLISHMENT serves a population that is not  
23           a HIGHLY SUSCEPTIBLE POPULATION; and

24           (2)    The CONSUMER is informed as specified under § 3-  
25           603.11 that to ensure its safety, the FOOD should  
26           be cooked as specified under ¶ (A) or (B) of this section;  
27           or

28           (3)    The REGULATORY AUTHORITY grants a VARIANCE  
29           from ¶ (A) or (B) of this section as specified in § 8-  
30           103.10 based on a HACCP PLAN that:

- 1 (a) *Is submitted by the PERMIT HOLDER and APPROVED*
- 2 *as specified under § 8-103.11,*
- 3 (b) *Documents scientific data or other*
- 4 *information showing that a lesser time and*
- 5 *temperature regimen results in a safe FOOD,*
- 6 *and*
- 7 (c) *Verifies that EQUIPMENT and procedures for*
- 8 *FOOD preparation and training of FOOD EMPLOYEES*
- 9 *at the FOOD ESTABLISHMENT meet the*
- 10 *conditions of the VARIANCE.*

**3-401.12 Microwave Cooking.\***

Raw animal FOODS cooked in a microwave oven shall be:

- 13 (A) Rotated or stirred throughout or midway during cooking
- 14 to compensate for uneven distribution of heat;
- 15 (B) Covered to retain surface moisture;
- 16 (C) Heated to a temperature of at least 74°C (165°F) in all
- 17 parts of the FOOD; and
- 18 (D) Allowed to stand covered for 2 minutes after cooking to
- 19 obtain temperature equilibrium.

**3-401.13 Plant Food Cooking for Hot Holding.**

Fruits and vegetables that are cooked for hot holding shall be cooked to a temperature of 60°C (140°F)

**Freezing**

**3-402.11 Parasite Destruction.\***

- 24 (A) Except as specified in ¶ (B) of this section, before
- 25 service or sale in READY-TO-EAT form, raw, raw-marinated,
- 26 partially cooked, or marinated-partially cooked FISH shall
- 27 be:

- 1 (1) Frozen and stored at a temperature of -20°C (-4°F)  
 2 or below for a minimum of 168 hours (7 days) in  
 3 a freezer;
- 4 (2) Frozen at -35°C (-31°F) or below until solid and  
 5 stored at -35°C (-31°F) or below for a minimum of  
 6 15 hours; or
- 7 (3) Frozen at -35°C (-31°F) or below until solid and  
 8 stored at -20°C (-4°F) or below for a minimum of  
 9 24 hours.
- 10 (B) *Paragraph (A) of this section does not apply to:*
- 11 (1) *MOLLUSCAN SHELLFISH;*
- 12 (2) *Tuna of the species Thunnus alalunga, Thunnus*  
 13 *albacares (Yellowfin tuna), Thunnus atlanticus,*  
 14 *Thunnus maccoyii (Bluefin tuna, Southern),*  
 15 *Thunnus obesus (Bigeye tuna), or Thunnus*  
 16 *thynnus (Bluefin tuna, Northern); or*
- 17 (3) *Aquacultured FISH, such as salmon, that:*
- 18 (a) *If raised in open water, are raised in net-pens,*  
 19 *or*
- 20 (b) *Are raised in land-based operations such as*  
 21 *ponds or tanks, and*
- 22 (c) *Are fed formulated feed, such as pellets,*  
 23 *that contains no live parasites infective to*  
 24 *the aquacultured FISH.*

### 3-402.12 Records, Creation and Retention.

- 26 (A) Except as specified in ¶ 3-402.11(B) and ¶ (B) of this  
 27 section, if raw, raw-marinated, partially cooked, or  
 28 marinated-partially cooked FISH are served or sold in  
 29 READY-TO-EAT form, the PERSON IN CHARGE shall record the  
 30 freezing temperature and time to which the FISH are

1 subjected and shall retain the records of the FOOD  
2 ESTABLISHMENT for 90 calendar days beyond the time of  
3 service or sale of the FISH.

4 (B) *If the FISH are frozen by a supplier, a written agreement*  
5 *or statement from the supplier stipulating that the FISH*  
6 *supplied are frozen to a temperature and for a time*  
7 *specified under § 3-402.11 may substitute for the records*  
8 *specified under ¶ (A) of this section.*

9 (C) If raw, raw-marinated, partially cooked, or marinated-  
10 partially cooked FISH are served or sold in READY-TO-EAT  
11 form, and the FISH are raised and fed as specified in  
12 Subparagraph 3-402.11 (B)(3), a written agreement or  
13 statement from the supplier or aquaculturist stipulating  
14 that the FISH were raised and fed as specified in  
15 Subparagraph 3-402.11(B)(3) shall be obtained by the  
16 PERSON IN CHARGE and retained in the records of the  
17 FOOD ESTABLISHMENT for 90 calendar days beyond the time  
18 of service or sale of the FISH.

19 **3-403.10 Preparation for Immediate Service.**

20 Cooked and refrigerated FOOD that is prepared for immediate  
21 service in response to an individual CONSUMER order, such as  
22 a roast beef sandwich au jus, may be served at any  
23 temperature.

24 ***Reheating***

25 **3-403.11 Reheating for Hot Holding.\***

26 (A) Except as specified under ¶¶ (B) and (C) and in ¶ (E)  
27 of this section, POTENTIALLY HAZARDOUS FOOD  
28 (TIME/TEMPERATURE CONTROL FOR SAFETY FOOD) that is  
29 cooked, cooled, and reheated for hot holding shall be  
30 reheated so that all parts of the FOOD reach a  
temperature of at least 74°C (165°F) for 15 seconds.

1 (B) Except as specified under ¶ (C) of this section,  
 2 POTENTIALLY HAZARDOUS FOOD (TIME/TEMPERATURE CONTROL FOR  
 3 SAFETY FOOD) reheated in a microwave oven for hot  
 4 holding shall be reheated so that all parts of the  
 5 FOOD reach a temperature of at least 74°C (165°F) and  
 6 the FOOD is rotated or stirred, covered, and allowed to  
 7 stand covered for 2 minutes after reheating.

8 (C) READY-TO-EAT FOOD taken from a commercially processed,  
 9 HERMETICALLY SEALED CONTAINER, or from an  
 10 intact package from a FOOD PROCESSING PLANT that is  
 11 inspected by the FOOD REGULATORY AUTHORITY that has  
 12 jurisdiction over the plant, shall be heated to a  
 13 temperature of at least 60°C (140°F) for hot holding.

14 (D) Reheating for hot holding as specified under ¶¶ (A) - (C)  
 15 of this section shall be done rapidly and the time the  
 16 FOOD is between 5°C (41°F) and the temperatures  
 17 specified under ¶¶ (A) - (C) of this section shall not  
 18 exceed 2 hours.

19 (E) *Remaining unsliced portions of MEAT roasts that are*  
 20 *cooked as specified under ¶ 3-401.11(B) may be*  
 21 *reheated for hot holding using the oven parameters and*  
 22 *minimum time and temperature conditions specified under*  
 23 *¶ 3-401.11(B).*

24 **Other Methods 3-404.11 Treating Juice.**

25 JUICE PACKAGED in a FOOD ESTABLISHMENT shall be:

26 (A) Treated under a HACCP PLAN as specified in ¶¶ 8-  
 27 201.12(B) - (E) to attain a 5-log reduction, which is equal  
 28 to a 99.999% reduction, of the most resistant  
 29 microorganism of public health significance; or

30 (B) Labeled, if not treated to yield a 5-log reduction of the

1 most resistant microorganism of public health  
2 significance:

3 (1) As specified under § 3-602.11, and

4 (2) As specified in 21 CFR 101.17(g) Food labeling,  
5 warning, notice, and safe handling statements,  
6 Juices that have not been specifically processed  
7 to prevent, reduce, or eliminate the presence of  
8 pathogens with the following, "WARNING: This  
9 product has not been pasteurized and, therefore,  
10 may contain harmful bacteria that can cause  
11 serious illness in children, the elderly, and  
12 persons with weakened immune systems."  
13

#### 14 **3-5 LIMITATION OF GROWTH OF ORGANISMS OF PUBLIC HEALTH CONCERN**

##### 15 ***Subparts***

16 **3-501 Temperature and Time Control**

17 **3-502 Specialized Processing Methods**

18  
19 ***Temperature*** **3-501.11 Frozen Food.**

20 ***and Time*** Stored frozen FOODS shall be maintained frozen.

21 ***Control***

22 **3-501.12 Potentially Hazardous Food Time/Temperature**  
23 **Control for Safety Food), Slacking.**

24 Frozen POTENTIALLY HAZARDOUS FOOD (TIME/TEMPERATURE CONTROL  
25 FOR SAFETY FOOD) that is slacked to moderate the temperature  
26 shall be held:

27 (A) Under refrigeration that maintains the FOOD temperature  
28 at 5°C (41°F) or less; or

29 (B) At any temperature if the FOOD remains frozen.

30 **3-501.13 Thawing.**

1 Except as specified in ¶(D) of this section, POTENTIALLY  
2 HAZARDOUS FOOD (TIME/TEMPERATURE CONTROL FOR SAFETY FOOD) shall  
3 be thawed:

4 (A) Under refrigeration that maintains the FOOD temperature  
5 at 5°C (41°F) or less; or

6 (B) Completely submerged under running water:

7 (1) At a water temperature of 21°C (70°F) or below,

8 (2) With sufficient water velocity to agitate and float  
9 off loose particles in an overflow, and

10 (3) For a period of time that does not allow thawed  
11 portions of READY-TO-EAT FOOD to rise above 5°C (41°F),  
12 or

13 (4) For a period of time that does not allow thawed  
14 portions of a raw animal FOOD requiring cooking as  
15 specified under ¶ 3 401.11(A) or (B) to be above  
16 5°C (41°F) for more than 4 hours including:

17 (a) The time the FOOD is exposed to the  
18 running water and the time needed for  
19 preparation for cooking, or

20 (b) The time it takes under refrigeration to  
21 lower the FOOD temperature to 5°C (41°F);

22 (C) As part of a cooking process if the FOOD that is frozen  
23 is:

24 (1) Cooked as specified under ¶ 3-401.11(A) or (B) or  
25 § 3-401.12, or

26 (2) Thawed in a microwave oven and immediately  
27 transferred to conventional cooking EQUIPMENT,  
28 with no interruption in the process; or

- 1 (D) *Using any procedure if a portion of frozen READY-TO-EAT*  
2 *FOOD is thawed and prepared for immediate service in*  
3 *response to an individual CONSUMER'S order.*

4 **3-501.14 Cooling.\***

- 5 (A) Cooked POTENTIALLY HAZARDOUS FOOD (TIME/TEMPERATURE  
6 CONTROL FOR SAFETY FOOD) shall be cooled:

- 7 (1) Within 2 hours from 57°C (135°F) to 21°C (70°F);  
8 and  
9 (2) Within a total of 6 hours from 57°C (135°F) to  
10 5°C (41°F) or less.

- 11 (B) POTENTIALLY HAZARDOUS FOOD (TIME/TEMPERATURE CONTROL FOR  
12 SAFETY FOOD) shall be cooled within 4 hours to 5°C (41°F)  
13 or less if prepared from ingredients at ambient temperature,  
14 such as reconstituted FOODS and canned tuna.

- 15 (C) Except as specified under ¶ (D) of this section, a  
16 POTENTIALLY HAZARDOUS FOOD (TIME/TEMPERATURE CONTROL FOR  
17 SAFETY FOOD) received in compliance with LAWS allowing a  
18 temperature above 5°C (41°F) during shipment from the  
19 supplier as specified in ¶ 3 202.11(B), shall be cooled  
20 within 4 hours to 5°C (41°F) or less.

- 21 (D) Raw EGGS shall be received as specified under ¶ 3-  
22 202.11(C) and immediately placed in refrigerated  
23 EQUIPMENT that maintains an ambient air temperature of  
24 7°C (45°F) or less.

25 **3-501.15 Cooling Methods.**

- 26 (A) Cooling shall be accomplished in accordance with the  
27 time and temperature criteria specified under § 3-501.14  
28 by using one or more of the following methods based  
29 on the type of FOOD being cooled:

- 30 (1) Placing the FOOD in shallow pans;

- 1 (2) Separating the FOOD into smaller or thinner  
 2 portions;
- 3 (3) Using rapid cooling EQUIPMENT;
- 4 (4) Stirring the FOOD in a container placed in an ice  
 5 water bath;
- 6 (5) Using containers that facilitate heat transfer;
- 7 (6) Adding ice as an ingredient; or
- 8 (7) Other effective methods.
- 9 (B) When placed in cooling or cold holding EQUIPMENT, FOOD  
 10 containers in which FOOD is being cooled shall be:
- 11 (1) Arranged in the EQUIPMENT to provide maximum  
 12 heat transfer through the container walls; and
- 13 (2) Loosely covered, or uncovered if protected from  
 14 overhead contamination as specified under  
 15 Subparagraph 3-305.11(A)(2), during the cooling  
 16 period to facilitate heat transfer from the surface  
 17 of the FOOD.
- 18 **3-501.16 Potentially Hazardous Food (Time/Temperature**  
 19 **Control for Safety Food), Hot and Cold Holding.\***
- 20 (A) *Except during preparation, cooking, or cooling, or when time*  
 21 *is used as the public health control as specified under §3*  
 22 *501.19, and except as specified under ¶ (B) and in ¶ (C*  
 23 *) of this section, POTENTIALLY HAZARDOUS FOOD*  
 24 *(TIME/TEMPERATURE CONTROL FOR SAFETY FOOD) shall be*  
 25 *maintained:*
- 26 (1) At 60°C (140°F) or above, except that roasts  
 27 cooked to a temperature and for a time specified  
 28 in ¶ 3 401.11(B) or reheated as specified in ¶ 3-  
 29 403.11(E) may be held at a temperature of 54°C  
 30 (130°F) or above; or

1 (2) At 5°C (41°F) or less.

2 (B) EGGS that have not been treated to destroy all viable  
3 **SALMONELLAE** shall be stored in refrigerated EQUIPMENT that  
4 maintains an ambient air temperature of 7°C (45°F) or  
5 less.

6 (C) POTENTIALLY HAZARDOUS FOOD (TIME/TEMPERATURE CONTROL FOR  
7 SAFETY FOOD) in a homogenous liquid form *may be*  
8 *maintained outside of the temperature control*  
9 *requirements, as specified under ¶ (A) of this section,*  
10 *while contained within specially designed EQUIPMENT that*  
11 *complies with the design and construction requirements*  
12 *as specified under ¶ 4-204.13(E).*

13 **3-501.17 Ready-to-Eat, Potentially Hazardous Food**  
14 **(Time/Temperature Control for Safety Food),**  
15 **Date Marking.\***

16 **on-premises**

17 **preparation**

- 18 • *prepare and*
- 19 *hold cold*

20 (A) Except when PACKAGING FOOD using a REDUCED OXYGEN  
21 PACKAGING method as specified under § 3-502.12, and  
22 except as specified in ¶¶ (D) and (E) of this section,  
23 refrigerated, READY-TO-EAT, POTENTIALLY HAZARDOUS FOOD  
24 (TIME/TEMPERATURE CONTROL FOR SAFETY FOOD) prepared and  
25 held in a FOOD ESTABLISHMENT for more than 24 hours  
26 shall be clearly marked to indicate the date or day by  
27 which the FOOD shall be consumed on the PREMISES, sold,  
28 or discarded when held at a temperature of 5°C (41°F)  
29 or less for a maximum of 7 days.

26 **commercially**

27 **Processed food**

- 28 • *open and*
- 29 *hold cold*

30 (B) Except as specified in ¶¶ (D) - (F) of this section,  
refrigerated, READY-TO-EAT, POTENTIALLY HAZARDOUS FOOD  
(TIME/TEMPERATURE CONTROL FOR SAFETY FOOD) prepared and  
PACKAGED by a FOOD PROCESSING PLANT shall be clearly  
marked, at the time the original container is opened in

1 a FOOD ESTABLISHMENT and if the FOOD is held for more  
2 than 24 hours, to indicate the date or day by which  
3 the FOOD shall be consumed on the PREMISES, sold, or  
4 discarded, based on the temperature and time  
5 combinations specified in (A) of this section and:

6 (1) The day the original container is opened in the  
7 FOOD ESTABLISHMENT shall be counted as Day 1; and

8 (2) The day or date marked by the FOOD  
9 ESTABLISHMENT may not exceed a manufacturer's  
10 use-by date if the manufacturer determined the  
11 use-by date based on FOOD safety.

12 (C) A refrigerated, READY-TO-EAT, POTENTIALLY HAZARDOUS FOOD  
13 (TIME/TEMPERATURE CONTROL FOR SAFETY FOOD) ingredient  
14 or a portion of a refrigerated, READY-TO-EAT, POTENTIALLY  
15 HAZARDOUS FOOD (TIME/TEMPERATURE CONTROL FOR SAFETY FOOD)  
16 that is subsequently combined with additional ingredients or  
17 portions of FOOD shall retain the date marking of the  
18 earliest-prepared or first-prepared ingredient.

19 (D) *A date marking system that meets the criteria stated in ¶¶*  
20 *(A) and (B) of this section may include:*

21 (1) *Using a method APPROVED by the REGULATORY*  
22 *AUTHORITY for refrigerated, READY-TO-EAT POTENTIALLY*  
23 *HAZARDOUS FOOD (TIME/TEMPERATURE CONTROL FOR*  
24 *SAFETY FOOD) that is frequently rewrapped, such as*  
25 *lunchmeat or a roast, or for which date marking*  
26 *is impractical, such as soft serve mix or milk in a*  
27 *dispensing machine;*

28 (2) *Marking the date or day of preparation, with a*  
29 *procedure to discard the FOOD or on before the*  
30 *last date or day by which the FOOD must be*

- 1 consumed on the premises, sold, or discarded as  
2 specified under ¶ (A) of this section;
- 3 (3) Marking the date or day the original container is  
4 opened in a FOOD ESTABLISHMENT, with a procedure  
5 to discard the FOOD on or before the last date or  
6 day by which the FOOD must be consumed on the  
7 premises, sold, or discarded as specified under ¶  
8 (B) of this section; or
- 9 (4) Using calendar dates, days of the week, color-  
10 coded marks, or other effective marking methods,  
11 provided that the marking system is disclosed to  
12 the REGULATORY AUTHORITY upon request.
- 13 (E) Paragraphs (A) and (B) of this section do not apply to individual  
14 meal portions served or repackaged for sale from a bulk  
15 container upon a consumer's request.
- 16 (F) Paragraph (B) of this section does not apply to the  
17 following FOODS prepared and PACKAGED by a FOOD PROCESSING  
18 PLANT inspected by a REGULATORY AUTHORITY:
- 19 (1) Deli salads, such as ham salad, seafood salad,  
20 chicken salad, egg salad, pasta salad, potato  
21 salad, and macaroni salad, manufactured in  
22 accordance with 21 CFR 110 Current good  
23 manufacturing practice in manufacturing, packing,  
24 or holding human food;
- 25 (2) Hard cheeses containing not more than 39%  
26 moisture as defined in 21 CFR 133 Cheeses and  
27 related cheese products, such as cheddar,  
28 gruyere, parmesan and reggiano, and romano;
- 29 (3) Semi-soft cheeses containing more than 39%  
30 moisture, but not more than 50% moisture, as

1 *defined in 21 CFR 133 Cheeses and related*  
 2 *cheese products, such as blue, edam, gorgonzola,*  
 3 *gouda, and monterey jack;*

4 (4) *Cultured dairy products as defined in 21 CFR 131*  
 5 *Milk and cream, such as yogurt, sour cream, and*  
 6 *buttermilk;*

7 (5) *Preserved FISH products, such as pickled herring*  
 8 *and dried or salted cod, and other acidified FISH*  
 9 *products defined in 21 CFR 114 Acidified foods;*

10 (6) *Shelf stable, dry fermented sausages, such as*  
 11 *pepperoni and Genoa salami that are not labeled*  
 12 *“Keep Refrigerated” as specified in 9 CFR 317 Labeling,*  
 13 *marking devices, and containers, and which retain*  
 14 *the original CASING on the product; and*

15 (7) *Shelf stable salt-cured products such as prosciutto*  
 16 *and Parma (ham) that are not labeled “Keep*  
 17 *Refrigerated” as specified in 9 CFR 317 Labeling,*  
 18 *marking devices, and containers.*

19 **3-501.18 Ready-to-Eat, Potentially Hazardous Food**  
 20 **(Time/Temperature Control for Safety Food),**  
 21 **Disposition.\***

22 (A) A FOOD specified in ¶ 3-501.17(A) or (B) shall be  
 23 discarded if it:

24 (1) Exceeds either of the temperature and time  
 25 combinations specified in ¶ 3-501.17(A), except  
 26 time that the product is frozen;

27 (2) Is in a container or PACKAGE that does not bear  
 28 a date or day; or

29 (3) Is appropriately marked with a date or day that  
 30 exceeds a temperature and time combination as

1 specified in ¶ 3-501.17(A).

- 2 (B) Refrigerated, READY-TO-EAT, POTENTIALLY HAZARDOUS FOOD  
3 (TIME/TEMPERATURE CONTROL FOR SAFETY FOOD) prepared in  
4 a FOOD ESTABLISHMENT and dispensed through a VENDING  
5 MACHINE with an automatic shutoff control shall be  
6 discarded if it exceeds a temperature and time  
7 combination as specified in ¶ 3-501.17(A).

8 **3-501.19 Time as a Public Health Control.\***

9 Deleted.

10 **Specialized**  
11 **Processing**  
12 **Methods**

13 **3-502.11 Variance Requirement.\***

14 A FOOD ESTABLISHMENT shall obtain a VARIANCE from the  
15 REGULATORY AUTHORITY as specified in § 8-103.10 and under  
16 § 8-103.11 before:

- 17 (A) Smoking FOOD as a method of FOOD preservation rather  
18 than as a method of flavor enhancement;
- 19 (B) Curing FOOD;
- 20 (C) Using FOOD ADDITIVES or adding components such as  
21 vinegar:  
22 (1) As a method of FOOD preservation rather than as a  
23 method of flavor enhancement, or  
24 (2) To render a FOOD so that it is not POTENTIALLY  
25 HAZARDOUS (TIME/TEMPERATURE CONTROL OF SAFETY  
26 FOOD);
- 27 (D) Packaging FOOD using a REDUCED OXYGEN PACKAGING method  
28 *except as specified under § 3-502.12 where a barrier to*  
29 ***Clostridium botulinum*** *in addition to refrigeration exists;*
- 30 (E) Operating a MOLLUSCAN SHELLFISH life-support system  
display tank used to store and display shellfish that are  
offered for human consumption;
- (F) Custom processing animals that are for personal use

1 as FOOD and not for sale or service in a FOOD  
2 ESTABLISHMENT;

3 (G) Preparing FOOD by another method that is determined  
4 by the REGULATORY AUTHORITY to require a VARIANCE; or

5 (H) Sprouting seeds or beans.

6 ***Clostridium*** 3-502.12 **Reduced Oxygen Packaging, Criteria.\***

7 ***botulinum and***

8 ***Listeria***

9 ***Monocytogenes***

10 **Controls**

(A) Except for a FOOD ESTABLISHMENT that obtains a VARIANCE  
as specified under § 3-502.11 and except as specified  
under ¶¶ (C) and (E) and as specified in ¶ (D) of this  
section, a FOOD ESTABLISHMENT that PACKAGES POTENTIALLY  
HAZARDOUS FOOD (TIME/TEMPERATURE CONTROL FOR SAFETY  
FOOD) using a REDUCED OXYGEN PACKAGING method shall  
ensure that there are at least two barriers in place to  
control the growth and toxin formation of ***Clostridium***  
***botulinum*** and the growth of ***Listeria monocytogenes***.

(B) A FOOD ESTABLISHMENT that PACKAGES POTENTIALLY HAZARDOUS  
FOOD (TIME/TEMPERATURE CONTROL FOR SAFETY FOOD) using a  
REDUCED OXYGEN PACKAGING method shall have a HACCP  
PLAN that contains the information specified under ¶  
8-201.14(D) and that:

(1) Identifies the FOOD to be PACKAGED;

(2) Except as specified under ¶¶ (C) and (E) and as  
specified in ¶ (D) of this section, requires that the  
PACKAGED FOOD shall be maintained at 5°C (41°F)  
or less and meet at least one of the following  
criteria:

(a) Has an  $A_w$  of 0.91 or less,

(b) Has a PH of 4.6 or less,

(c) Is a MEAT or POULTRY product cured at  
a FOOD PROCESSING PLANT regulated

1 by the USDA using substances  
2 specified in 9 CFR 424.21, Use of  
3 food ingredients and sources of  
4 radiation, and is received in an intact  
5 PACKAGE, or

6 (d) Is a FOOD with a high level of  
7 competing organisms such as rawMEAT  
8 or raw POULTRY;

9 (3) Describes how the PACKAGE shall be prominently  
10 and conspicuously labeled on the principal display  
11 panel in bold type on a contrasting background,  
12 with instructions to:

13 (a) Maintain the FOOD at 5°C (41°F) or below,  
14 and

15 (b) Discard the FOOD if within 14 calendar  
16 days of its PACKAGING it is not served for  
17 on-PREMISES consumption, or consumed if  
18 served or sold for off-PREMISES consumption;

19 (4) Limits the refrigerated shelf life to no more than  
20 14 calendar days from PACKAGING to consumption,  
21 except the time the product is maintained frozen,  
22 or the original manufacturer's "sell by" or "use by"  
23 date, whichever occurs first;

24 (5) Includes operational procedures that:

25 (a) Prohibit contacting FOOD with bare hands,

26 (b) Identify a designated work area and the  
27 method by which:

28 (i) Physical barriers or methods of  
29 separation of raw FOODS and READY-  
30 TO-EAT FOODS minimize cross

- 1 contamination, and
- 2 (ii) Access to the processing EQUIPMENT
- 3 is limited to responsible trained
- 4 personnel familiar with the potential
- 5 HAZARDS of the operation, and
- 6 (c) Delineate cleaning and SANITIZATION
- 7 procedures for FOOD-CONTACT SURFACES; and
- 8 (6) Describes the training program that ensures that
- 9 the individual responsible for the REDUCED OXYGEN
- 10 PACKAGING operation understands the:
- 11 (a) Concepts required for a safe operation,
- 12 (b) EQUIPMENT and facilities, and
- 13 (c) Procedures specified under Subparagraph
- 14 (B)(5) of this section and ¶ 8-201.14(D).
- 15 *Fish* (C) *Except for FISH that is frozen before, during, and after*
- 16 *PACKAGING, a FOOD ESTABLISHMENT shall not PACKAGE FISH*
- 17 *using a REDUCED OXYGEN PACKAGING method.*
- 18 *Cook-Chill or* (D) *Except as specified under ¶ (C) of this section, a FOOD*
- 19 *Sous Vide* *ESTABLISHMENT may package FOOD using a cook-chill or*
- 20 *sous vide process without obtaining a VARIANCE if:*
- 21 (1) *The FOOD ESTABLISHMENT implements a HACCP PLAN*
- 22 *that contains the information as specified under ¶ 8-*
- 23 *201.14(D);*
- 24 (2) *The FOOD is:*
- 25 (a) *Prepared and consumed on the PREMISES,*
- 26 *or prepared and consumed off the PREMISES*
- 27 *but within the same business entity with no*
- 28 *distribution or sale of the bagged product to*
- 29 *another business entity or the CONSUMER,*
- 30 (b) *Cooked to heat all parts of the FOOD to a*

1                    *temperature and for a time as specified*  
2                    *under § 3-401.11,*

3                    (c) *Protected from contamination after cooking*  
4                    *as specified under Part 3-4,*

5                    (d) *Placed in a package or bag with an oxygen*  
6                    *barrier and sealed before cooking, or placed*  
7                    *in a PACKAGE or bag and sealed*  
8                    *immediately after cooking, and before*  
9                    *reaching a temperature below 57°C (135°F),*

10                    (e) *Cooled to 5°C (41°F) in the sealed PACKAGE*  
11                    *or bag as specified under §3-501.14, and*  
12                    *subsequently:*

13                    (i) *Cooled to 1°C (34°F) within 48 hours*  
14                    *of reaching 5°C (41°F) and held at*  
15                    *that temperature until consumed or*  
16                    *discarded within 30 days after the*  
17                    *date of preparation;*

18                    (ii) *Cooled to 1°C (34°F) within 48 hours*  
19                    *of reaching 5°C (41°F), removed from*  
20                    *refrigeration equipment that maintains*  
21                    *a 1°C (34°F) food temperature and*  
22                    *then held at 5°C (41°F) or less for no*  
23                    *more than 72 hours, at which time the*  
24                    *FOOD must be consumed or*  
25                    *discarded;*

26                    (iii) *Cooled to 3°C (38°F) or less within*  
27                    *24 hours of reaching 5°C (41°F) and*  
28                    *held there for no more than 72 hours*  
29                    *from packaging, at which time the*  
30                    *food must be consumed or*

discarded; or

(iv) *Held frozen with no shelf life restriction while frozen until consumed or used.*

(f) *Held in a refrigeration unit that is equipped with an electronic system that continuously monitors time and temperature and is visually examined for proper operation twice daily,*

(g) *If transported off-site to a satellite location of the same business entity, equipped with verifiable electronic monitoring devices to ensure that times and temperatures are monitored during transportation, and*

(h) *Labeled with the product name and the date PACKAGED; and*

(3) *The records required to confirm that cooling and cold holding refrigeration time/temperature parameters are required as part of the HACCP PLAN, are maintained and are:*

(a) *Made available to the REGULATORY AUTHORITY upon request, and*

(b) *Held for 6 months; and*

(4) *Written operational procedures as specified under Subparagraph (B)(5) of this section and a training program as specified under Subparagraph (B)(6) of this section are implemented.*

*Cheese (E) A FOOD ESTABLISHMENT may PACKAGE cheese using a REDUCED OXYGEN PACKAGING method without obtaining a VARIANCE if it:*

(1) *Limits the cheeses PACKAGED to those that are*

1 commercially manufactured in a FOOD PROCESSING PLANT  
 2 with no ingredients added in the FOOD ESTABLISHMENT  
 3 and that meet the Standards of Identity as specified in  
 4 21 CFR 133.150 Hard cheeses, 21 CFR 133.169  
 5 Pasteurized process cheese or 21 CFR 133.187  
 6 Semisoft cheeses;

7 (2) Has a HACCP PLAN that contains the information  
 8 specified under ¶ 8-201.14(D);

9 (3) Except as specified under Subparagraphs (B)(2),  
 10 (B)(3)(b), and (B)(4), complies with ¶ (B) of this  
 11 section;

12 (4) Labels the PACKAGE on the principal display panel  
 13 with a “use by” date that does not exceed 30  
 14 days or the original manufacturer’s “sell by” or  
 15 “use by” date, whichever occurs first; and

16 (5) Discards the REDUCED OXYGEN PACKAGED cheese  
 17 if it is not sold for off-PREMISES consumption or  
 18 consumed within 30 calendar days of its  
 19 PACKAGING.

## 21 3-6 FOOD IDENTITY, PRESENTATION, AND ON-PREMISES LABELING

### 22 *Subparts*

23 **3-601 Accurate Representation**

24 **3-602 Labeling**

25 **3-603 Consumer Advisory**

26  
 27 ***Accurate* 3-601.11 Standards of Identity**

28 ***Representation*** PACKAGED FOOD shall comply with standard of identity  
 29 requirements and standards of identity or composition, and the

1 general requirements in 21 CFR 130 – Food Standards: General  
2 and 9 CFR 319 Subpart A – General.

3 **3-601.12 Honestly Presented.**

- 4 (A) FOOD shall be offered for human consumption in a way  
5 that does not mislead or misinform the CONSUMER.  
6 (B) FOOD or COLOR ADDITIVES, colored overwraps, or lights  
7 shall not be used to misrepresent the true appearance,  
8 color, or quality of a FOOD.

9 **Labeling**

3-602.11 **Food Labels.**

- 10 (A) FOOD PACKAGED in a FOOD ESTABLISHMENT, shall be labeled  
11 as specified in LAW, including 21 CFR 101 - Food  
12 labeling, and 9 CFR 317 Labeling, marking devices, and  
13 containers.  
14 (B) Label information shall include:  
15 (1) The common name of the FOOD, or absent a common  
16 name, an adequately descriptive identity statement;  
17 (2) If made from two or more ingredients, a list of  
18 ingredients in descending order of predominance  
19 by weight, including a declaration of artificial color  
20 or flavor and chemical preservatives, if contained  
21 in the FOOD;  
22 (3) An accurate declaration of the quantity of  
23 contents;  
24 (4) The name and place of business of the manufacturer,  
25 packer, or distributor; and  
26 (5) The name of the FOOD source for each MAJOR  
27 FOOD ALLERGEN contained in the FOOD unless the  
28 FOOD source is already part of the common or  
29 usual name of the respective ingredient (Effective  
30 January 1, 2006).

- 1 (6) Except as exempted in the Federal Food, Drug,  
2 and Cosmetic Act § 403(Q)(3) - (5), nutrition  
3 labeling as specified in 21 CFR 101 - Food  
4 Labeling and 9 CFR 317 Subpart B Nutrition  
5 Labeling.
- 6 (7) For any salmonid FISH containing canthaxanthin  
7 as a COLOR ADDITIVE, the labeling of the bulk FISH  
8 container, including a list of ingredients, displayed  
9 on the retail container or by other written means,  
10 such as a counter card, that discloses the use of  
11 canthaxanthin.
- 12 (C) Bulk FOOD that is available for CONSUMER self-dispensing  
13 shall be prominently labeled with the following  
14 information in plain view of the CONSUMER:
- 15 (1) The manufacturer's or processor's label that was  
16 provided with the FOOD; or
- 17 (2) A card, sign, or other method of notification that  
18 includes the information specified under  
19 Subparagraphs (B)(1), (2), and (5) of this section.
- 20 (D) *Bulk, unPACKAGED FOODS such as bakery products and*  
21 *unPACKAGED FOODS that are portioned to CONSUMER*  
22 *specification need not be labeled if:*
- 23 (1) *A health, nutrient content, or other claim is not*  
24 *made;*
- 25 (2) *There are no state or local LAWS requiring labeling;*  
26 *and*
- 27 (3) *The FOOD is manufactured or prepared on the*  
28 *PREMISES of the FOOD ESTABLISHMENT or at another*  
29 *FOOD ESTABLISHMENT or a FOOD PROCESSING PLANT that*  
30 *is owned by the same PERSON and is regulated by*

*the FOOD regulatory agency that has jurisdiction.*

**3-602.12 Other Forms of Information.**

- (A) If required by LAW, CONSUMER warnings shall be provided.
- (B) FOOD ESTABLISHMENT or manufacturers' dating information on FOODS shall not be concealed or altered.

**Consumer  
Advisory**

**3-603.11 Consumption of Animal Foods that are Raw, Undercooked, or Not Otherwise Processed to Eliminate Pathogens.\***

(A) Except as specified in ¶ 3-401.11(C) and Subparagraph 3-401.11(D)(3) and under ¶ 3-801.11(C), if an animal FOOD such as beef, EGGS, FISH, lamb, milk, pork, POULTRY, or shellfish is served or sold raw, undercooked, or without otherwise being processed to eliminate pathogens, either in READY-TO-EAT form or as an ingredient in another READY-TO-EAT FOOD, the PERMIT HOLDER shall inform CONSUMERS of the significantly increased RISK of consuming such FOODS by way of a DISCLOSURE and REMINDER, as specified in ¶¶ (B) and (C) of this section using brochures, deli case or menu advisories, label statements, table tents, placards, or other effective written means.

- (B) DISCLOSURE shall include:
  - (1) A description of the animal-derived FOODS, such as “oysters on the half shell (raw oysters),” “raw-EGG Caesar salad,” and “hamburgers (can be cooked to order);” or
  - (2) Identification of the animal-derived FOODS by asterisking them to a footnote that states that the items are served raw or undercooked, or contain (or may contain) raw or undercooked ingredients.

- 1 (C) REMINDER shall include asterisking the animal-derived
- 2 FOODS requiring DISCLOSURE to a footnote that states:
- 3 (1) Regarding the safety of these items, written
- 4 information is available upon request;
- 5 (2) Consuming raw or undercooked MEATS, POULTRY,
- 6 seafood, shellfish, or EGGS may increase your
- 7 RISK of foodborne illness; or
- 8 (3) Consuming raw or undercooked MEATS, POULTRY,
- 9 seafood, shellfish, or EGGS may increase your
- 10 RISK of foodborne illness, especially if you have
- 11 certain medical conditions.
- 12

13 **3-7 CONTAMINATED FOOD**

14 ***Subpart***

15 **3-701 Disposition**

17 ***Disposition* 3-701.11 Discarding or Reconditioning Unsafe,**  
18 **Adulterated, or Contaminated Food.\***

- 19 (A) A FOOD that is unsafe, ADULTERATED, or not honestly
- 20 presented as specified under § 3-101.11 shall be
- 21 discarded or reconditioned according to an APPROVED
- 22 procedure.
- 23 (B) FOOD that is not from an APPROVED source as specified
- 24 under §§ 3-201.11 - .17 shall be discarded.
- 25 (C) READY-TO-EAT FOOD that may have been contaminated
- 26 by an EMPLOYEE who has been RESTRICTED or EXCLUDED as
- 27 specified under § 2-201.12 shall be discarded.
- 28 (D) FOOD that is contaminated by FOOD EMPLOYEES, CONSUMERS,
- 29 or other PERSONS through contact with their hands, bodily
- 30 discharges, such as nasal or oral discharges, or other

means shall be discarded.

### 3-8 SPECIAL REQUIREMENTS FOR HIGHLY SUSCEPTIBLE POPULATIONS

#### *Subpart*

#### **3-801 Additional Safeguards**

#### ***Additional Safeguards* 3-801.11 Pasteurized Foods, Prohibited Re-Service, and Prohibited Food\***

In a FOOD ESTABLISHMENT that serves a HIGHLY SUSCEPTIBLE POPULATION:

(A) The following criteria apply to JUICE:

- (1) For the purposes of this paragraph only, children who are age 9 or less and receive FOOD in a school, day care setting, or similar facility that provides custodial care are included as HIGHLY SUSCEPTIBLE POPULATIONS;
- (2) PrePACKAGED JUICE or a prePACKAGED BEVERAGE containing JUICE, that bears a warning label as specified in 21 CFR, 101.17(g) Food labeling, warning, notice, and safe handling statements, Juices that have not been specifically processed to prevent, reduce, or eliminate the presence of pathogens, or a PACKAGED JUICE or BEVERAGE containing JUICE, that bears a warning label as specified under ¶ 3-404.11(B) shall not be served or offered for sale; and
- (3) UNPACKAGED JUICE that is prepared on the premises for service or sale in a READY-TO-EAT form shall be processed under a HACCP PLAN that contains the information specified under ¶¶ 8-

1 201.14(B) - (E) and as specified in 21 CFR Part  
2 120 – Hazard Analysis and Critical Control Point  
3 (HACCP) Systems, Subpart B Pathogen  
4 Reduction, 120.24 Process controls.

5 (B) Pasteurized EGGS or EGG PRODUCTS shall be substituted  
6 for raw EGGS in the preparation of:

7 (1) FOODS such as Caesar salad, hollandaise or  
8 Béarnaise sauce, mayonnaise, meringue, EGGnog,  
9 ice cream, and EGG-fortified BEVERAGES, and

10 (2) Except as specified in ¶(F) of this section, recipes  
11 in which more than one EGG is broken and the  
12 EGGS are combined;

13 (C) The following FOODS shall not be served or offered for  
14 sale in a READY-TO-EAT form:

15 (1) Raw animal FOODS such as raw FISH, raw-  
16 marinated FISH, raw MOLLUSCAN SHELLFISH, and steak  
17 tartare,

18 (2) A partially cooked animal FOOD such as lightly  
19 cooked FISH, rare MEAT, soft-cooked EGGS that are  
20 made from raw EGGS, and meringue; and

21 (3) Raw seed sprouts.

22 (D) FOOD EMPLOYEES shall not contact READY-TO-EAT FOOD as  
23 specified under ¶¶ 3-301.11(B) and (D).

24 (E) Reserved.

25 (F) *Subparagraph (B)(2) of this section does not apply if:*

26 (1) *The raw EGGS are combined immediately before*  
27 *cooking for one CONSUMER'S serving at a single*  
28 *meal, cooked as specified under Subparagraph*  
29 *3-401.11(A)(1), and served immediately, such as*  
30 *an omelet, soufflé, or scrambled EGGS;*

- 1 (2) *The raw EGGS are combined as an ingredient*  
 2 *immediately before baking and the EGGS are*  
 3 *thoroughly cooked to a READY-TO-EAT form, such*  
 4 *as a cake, muffin, or bread; or*
- 5 (3) *The preparation of the food is conducted under a*  
 6 *HACCP PLAN that:*
- 7 (a) *Identifies the FOOD to be prepared,*  
 8 (b) *Prohibits contacting READY-TO-EAT FOOD with bare*  
 9 *hands,*  
 10 (c) *Includes specifications and practices that ensure:*  
 11  
 12 (i) **Salmonella Enteritidis** *growth is controlled*  
 13 *before and after cooking, and*  
 14 (ii) **Salmonella Enteritidis** *is destroyed by*  
 15 *cooking the EGGS according to the*  
 16 *temperature and time specified in*  
 17 *Subparagraph 3-401.11(A)(2),*  
 18 (d) *Contains the information specified under ¶ 8-*  
 19 *201.14(D) including procedures that:*  
 20 (i) *Control cross contamination of READY-TO-EAT*  
 21 *FOOD with raw EGGS, and*  
 22 (ii) *Delineate cleaning and SANITIZATION*  
 23 *procedures for FOOD-CONTACT SURFACES,*  
 24 *and*  
 25 (e) *Describes the training program that ensures*  
 26 *that the FOOD EMPLOYEE responsible for the*  
 27 *preparation of the FOOD understands the*  
 28 *procedures to be used.*
- 29 *Re-service of* (G) *Except as specified in paragraph (H) of this section,*  
 30 *Food* *FOOD may be re-served as specified under Subparagraph*

3-306.14(B)(1) and (2).

1  
2 *Prohibited*  
3 *Re-service of*  
4 *Food*

(H) *FOOD shall not be re-served under the following conditions.*

(1) *Any FOOD served to patients or clients who are under contact precautions in medical isolation or quarantine, or protective environment isolation shall not be re-served to others outside.*

(2) *Packages of FOOD from any patients, clients, or other CONSUMERS should not be re-served to PERSONS in protective environment isolation.*

20 Materials that are used in the construction of UTENSILS and  
 21 FOOD-CONTACT SURFACES of EQUIPMENT shall not allow the  
 22 migration of deleterious substances or impart colors, odors, or  
 23 tastes to FOOD and under normal use conditions shall be:

24 (A) Safe;

25 (B) Durable, CORROSION-RESISTANT, and nonabsorbent;<sup>N</sup>26 (C) Sufficient in weight and thickness to withstand repeated  
 27 WAREWASHING;<sup>N</sup>28 (D) Finished to have a SMOOTH, EASILY CLEANABLE surface;<sup>N</sup> and

(E) Resistant to pitting, chipping, crazing, scratching, scoring, distortion, and decomposition.<sup>N</sup>

**4-101.12 Cast Iron, Use Limitation.**

(A) Except as specified in ¶¶ (B) and (C) of this section, cast iron shall not be used for UTENSILS or FOOD-CONTACT SURFACES of EQUIPMENT.

B) *Cast iron may be used as a surface for cooking.*

(C) *Cast iron may be used in UTENSILS for serving FOOD if the UTENSILS are used only as part of an uninterrupted process from cooking through service.*

**4-101.13 Lead, Use Limitation.**

(A) Ceramic, china, and crystal UTENSILS, and decorative UTENSILS such as hand painted ceramic or china that are used in contact with FOOD shall be lead-free or contain levels of lead not exceeding the limits of the following UTENSIL categories:

UTENSIL Category	Ceramic Article Description	Maximum Lead MG/L
Beverage Mugs, Cups, Pitchers	Coffee Mugs	0.5
Large Hollowware (excluding pitchers)	Bowls $\geq$ 1.1 Liter (1.16 Quart)	1
Small Hollowware (excluding cups & mugs)	Bowls < 1.1 Liter (1.16 Quart)	2.0
Flat TABLEWARE	Plates, Saucers	3.0

1 (B) Pewter alloys containing lead in excess of 0.05% shall  
2 not be used as a FOOD-CONTACT SURFACE.

3 (C) Solder and flux containing lead in excess of 0.2% shall  
4 not be used as a FOOD-CONTACT SURFACE.

5 **4-101.14 Copper, Use Limitation.\***

6 (A) Except as specified in ¶¶ (B) of this section, copper and  
7 copper alloys such as brass shall not be used in  
8 contact with a FOOD that has a pH below 6 such as  
9 vinegar, fruit JUICE, or wine or for a fitting or tubing  
10 installed between a backflow prevention device and a  
11 carbonator.

12 (B) *Copper and copper alloys may be used in contact with*  
13 *beer brewing ingredients that have a pH below 6 in the*  
14 *prefermentation and fermentation steps of a beer brewing*  
15 *operation such as a brewpub or microbrewery.*

16 **4-101.15 Galvanized Metal, Use Limitation.\***

17 Galvanized metal shall not be used for UTENSILS or FOOD-CONTACT  
18 SURFACES of EQUIPMENT that are used in contact with acidic FOOD.

19 **4-101.16 Sponges, Use Limitation.**

20 Sponges shall not be used in contact with cleaned and  
21 SANITIZED or in-use FOOD-CONTACT SURFACES.

22 **4-101.17 Wood, Use Limitation.**

23 (A) Except as specified in ¶¶ (B), (C), and (D) of this section,  
24 wood and wood wicker shall not be used as a FOOD-  
25 CONTACT SURFACE.

26 (B) *Hard maple or an equivalently hard, close-grained wood*  
27 *may be used for:*

- 28 (1) *Cutting boards; cutting blocks; bakers' tables; and*  
29 *UTENSILS such as rolling pins, doughnut dowels,*  
30 *salad bowls, and chopsticks; and*

(2) *Wooden paddles used in confectionery operations for pressure scraping kettles when manually preparing confections at a temperature of 110°C (230°F) or above.*

(C) *Whole, uncut, raw fruits and vegetables, and nuts in the shell may be kept in the wood shipping containers in which they were received, until the fruits, vegetables, or nuts are used.*

(D) *If the nature of the FOOD requires removal of rinds, peels, husks, or shells before consumption, the whole, uncut, raw FOOD may be kept in:*

(1) *Untreated wood containers; or*

(2) *Treated wood containers if the containers are treated with a preservative that meets the requirements specified in 21 CFR 178.3800 Preservatives for wood.*

**4-101.18 Nonstick Coatings, Use Limitation.**

MULTIUSE KITCHENWARE such as frying pans, griddles, sauce pans, cookie sheets, and waffle bakers that have a perfluorocarbon resin coating shall be used with nonscoring or nonscratching UTENSILS and cleaning aids.

**4-101.19 Nonfood-Contact Surfaces.**

NONFOOD-CONTACT SURFACES OF EQUIPMENT that are exposed to splash, spillage, or other FOOD soiling or that require frequent cleaning shall be constructed of a CORROSION-RESISTANT, nonabsorbent, and SMOOTH material.

**Single-Service 4-102.11 Characteristics.\***

**and Single-Use** Materials that are used to make SINGLE-SERVICE and SINGLE-USE ARTICLES:

(A) May not:

- 1 (1) Allow the migration of deleterious substances, or  
 2 (2) Impart colors, odors, or tastes to FOOD;<sup>N</sup> and  
 3 (B) Shall be:  
 4 (1) Safe, and  
 5 (2) Clean.<sup>N</sup>  
 6

## 7 4-2 DESIGN AND CONSTRUCTION

### 8 *Subparts*

9 **4-201 Durability and Strength**

10 **4-202 Cleanability**

11 **4-203 Accuracy**

12 **4-204 Functionality**

13 **4-205 Acceptability**  
 14

### 15 ***Durability and*** 16 ***Strength***

**4-201.11 Equipment and Utensils.**

EQUIPMENT and UTENSILS shall be designed and constructed to be durable and to retain their characteristic qualities under normal use conditions.

**4-201.12 Food Temperature Measuring Devices.\***

FOOD TEMPERATURE MEASURING DEVICES shall not have sensors or stems constructed of glass, *except that thermometers with glass sensors or stems that are encased in a shatterproof coating such as candy thermometers may be used.*

### 24 ***Cleanability***

**4-202.11 Food-Contact Surfaces.\***

(A) Multiuse FOOD-CONTACT SURFACES shall be:

- 26 (1) SMOOTH;  
 27 (2) Free of breaks, open seams, cracks, chips,  
 28 inclusions, pits, and similar imperfections;  
 29 (3) Free of sharp internal angles, corners, and  
 30 crevices;

- 1 (4) Finished to have SMOOTH welds and joints; and  
2 (5) Except as specified in ¶ (B) of this section,  
3 accessible for cleaning and inspection by one of  
4 the following methods:  
5 (a) Without being disassembled,  
6 (b) By disassembling without the use of tools,  
7 or  
8 (c) By easy disassembling with the use of  
9 handheld tools commonly available to  
10 maintenance and cleaning personnel such  
11 as screwdrivers, pliers, open-end wrenches,  
12 and Allen wrenches.

13 (B) *Subparagraph (A)(5) of this section does not apply to*  
14 *cooking oil storage tanks, distribution lines for cooking*  
15 *oils, or BEVERAGE syrup lines or tubes.*

16 **4-202.12 CIP Equipment.**

- 17 (A) CIP EQUIPMENT shall meet the characteristics specified  
18 under § 4-202.11 and shall be designed and constructed  
19 so that:  
20 (1) Cleaning and SANITIZING solutions circulate  
21 throughout a fixed system and contact all interior  
22 FOOD-CONTACT SURFACES, and  
23 (2) The system is self-draining or capable of being  
24 completely drained of cleaning and SANITIZING  
25 solutions; and  
26 (B) CIP EQUIPMENT that is not designed to be disassembled  
27 for cleaning shall be designed with inspection access  
28 points to ensure that all interior FOOD-CONTACT SURFACES  
29 throughout the fixed system are being effectively  
30 cleaned.

**4-202.13 “V” Threads, Use Limitation.**

*Except for hot oil cooking or filtering EQUIPMENT, “V” type threads shall not be used on FOOD-CONTACT SURFACES.*

**4-202.14 Hot Oil Filtering Equipment.**

Hot oil filtering EQUIPMENT shall meet the characteristics specified under § 4-202.11 or § 4-202.12 and shall be readily accessible for filter replacement and cleaning of the filter.

**4-202.15 Can Openers.**

Cutting or piercing parts of can openers shall be readily removable for cleaning and for replacement.

**4-202.16 Nonfood-Contact Surfaces.**

NONFOOD-CONTACT SURFACES shall be free of unnecessary ledges, projections, and crevices, and designed and constructed to allow easy cleaning and to facilitate maintenance.

**4-202.17 Kick Plates, Removable.**

Kick plates shall be designed so that the areas behind them are accessible for inspection and cleaning by being:

- (A) Removable by one of the methods specified under Subparagraph 4-202.11(A)(5) or capable of being rotated open; and
- (B) Removable or capable of being rotated open without unlocking EQUIPMENT doors.

**4-202.18 Ventilation Hood Systems, Filters.**

Filters or other grease extracting EQUIPMENT shall be designed to be readily removable for cleaning and replacement if not designed to be cleaned in place.

**Accuracy****4-203.11 Temperature Measuring Devices, Food.**

- (A) FOOD TEMPERATURE MEASURING DEVICES that are scaled only in Celsius or dually scaled in Celsius and Fahrenheit

1 shall be accurate to  $\pm 1^{\circ}\text{C}$  in the intended range of use.

- 2 (B) FOOD TEMPERATURE MEASURING DEVICES that are scaled only  
3 in Fahrenheit shall be accurate to  $\pm 2^{\circ}\text{F}$  in the intended  
4 range of use.

5 **4-203.12 Temperature Measuring Devices, Ambient Air**  
6 **and Water.**

- 7 (A) Ambient air and water TEMPERATURE MEASURING DEVICES that  
8 are scaled in Celsius or dually scaled in Celsius and  
9 Fahrenheit shall be designed to be easily readable and  
10 accurate to  $\pm 1.5^{\circ}\text{C}$  in the intended range of use.

- 11 (B) Ambient air and water TEMPERATURE MEASURING DEVICES that  
12 are scaled only in Fahrenheit shall be accurate to  $\pm 3^{\circ}\text{F}$  in  
13 the intended range of use.

14 **4-203.13 Pressure Measuring Devices, Mechanical**  
15 **Warewashing Equipment.**

16 Pressure measuring devices that display the pressures in the  
17 water supply line for the fresh hot water *sanitizing* rinse shall  
18 have increments of 7 kilopascals (1 pound per square inch) or  
19 smaller and shall be accurate to  $\pm 14$  kilopascals ( $\pm 2$  pounds  
20 per square inch) in the range indicated on the manufacturer's  
21 data plate.

22 **Functionality 4-204.11 Ventilation Hood Systems, Drip Prevention.**

23 Exhaust ventilation hood systems in FOOD preparation and  
24 WAREWASHING areas including components such as hoods,  
25 fans, guards, and ducting shall be designed to prevent grease  
26 or condensation from draining or dripping onto FOOD,  
27 EQUIPMENT, UTENSILS, LINENS, and SINGLE-SERVICE and SINGLE-USE  
28 ARTICLES.

29 **4-204.12 Equipment Openings, Closures and Deflectors.**

- 30 (A) A cover or lid for EQUIPMENT shall overlap the opening

1 and be sloped to drain.

2 (B) An opening located within the top of a unit of  
3 EQUIPMENT that is designed for use with a cover or lid  
4 shall be flanged upward at least 5 millimeters (two-tenths  
5 of an inch).

6 (C) Except as specified under ¶ (D) of this section, fixed  
7 piping, TEMPERATURE MEASURING DEVICES, rotary shafts, and  
8 other parts extending into EQUIPMENT shall be provided  
9 with a watertight joint at the point where the item enters  
10 the EQUIPMENT.

11 (D) If a watertight joint is not provided:

12 (1) The piping, TEMPERATURE MEASURING DEVICES, rotary  
13 shafts, and other parts extending through the  
14 openings shall be equipped with an apron  
15 designed to deflect condensation, drips, and dust  
16 from openings into the FOOD; and

17 (2) The opening shall be flanged as specified under  
18 ¶ (B) of this section.

19 **4-204.13 Dispensing Equipment, Protection of Equipment**  
20 **and Food.**

21 In EQUIPMENT that dispenses or vends liquid FOOD or ice in  
22 UNPACKAGED form:

23 (A) The delivery tube, chute, orifice, and splash surfaces  
24 directly above the container receiving the FOOD shall be  
25 designed in a manner, such as with barriers, baffles, or  
26 drip aprons, so that drips from condensation and splash  
27 are diverted from the opening of the container receiving  
28 the FOOD;

29 (B) The delivery tube, chute, and orifice shall be protected  
30 from manual contact such as by being recessed;

- 1 (C) The delivery tube or chute and orifice of EQUIPMENT  
2 used to vend liquid FOOD or ice in UNPACKAGED form to  
3 self-service CONSUMERS shall be designed so that the  
4 delivery tube or chute and orifice are protected from  
5 dust, insects, rodents, and other contamination by a  
6 self-closing door if the EQUIPMENT is:
- 7 (1) Located in an outside area that does not  
8 otherwise afford the protection of an enclosure  
9 against the rain, windblown debris, insects,  
10 rodents, and other contaminants that are present  
11 in the environment, or
- 12 (2) Available for self-service during hours when it is  
13 not under the full-time supervision of a FOOD  
14 EMPLOYEE; and
- 15 (D) The dispensing EQUIPMENT actuating lever or mechanism  
16 and filling device of CONSUMER self-service BEVERAGE  
17 dispensing EQUIPMENT shall be designed to prevent  
18 contact with the lip-contact surface of glasses or cups  
19 that are refilled.
- 20 (E) Dispensing *equipment* in which *potentially hazardous*  
21 *food (time/temperature control for safety food)* in a  
22 homogenous liquid form is maintained outside of the  
23 temperature control requirements as specified under §3-  
24 501.16(A) shall:
- 25 (1) be specifically designed and equipped to maintain  
26 the commercial sterility of aseptically *packaged*  
27 *food* in a homogenous liquid form for a specified  
28 duration from the time of opening the *packaging*  
29 within the *equipment*; and
- 30 (2) conform to the requirements for this *equipment* as

1 specified in *NSF/ANSI 18-2006- Manual Food and*  
2 *Beverage Dispensing Equipment.*

3 **4-204.14 Vending Machine, Vending Stage Closure.**

4 The dispensing compartment of a VENDING MACHINE including a  
5 machine that is designed to vend prePACKAGED snack FOOD  
6 that is not POTENTIALLY HAZARDOUS (TIME/TEMPERATURE CONTROL FOR  
7 SAFETY FOOD) such as chips, party mixes, and pretzels shall  
8 be equipped with a self-closing door or cover if the machine is:

- 9 (A) Located in an outside area that does not otherwise  
10 afford the protection of an enclosure against the rain,  
11 windblown debris, insects, rodents, and other  
12 contaminants that are present in the environment; or  
13 (B) Available for self-service during hours when it is not  
14 under the full-time supervision of a FOOD EMPLOYEE.

15 **4-204.15 Bearings and Gear Boxes, Leak proof.**

16 EQUIPMENT containing bearings and gears that require  
17 lubricants shall be designed and constructed so that the  
18 lubricant cannot leak, drip, or be forced into FOOD or onto  
19 FOOD-CONTACT SURFACES.

20 **4-204.16 Beverage Tubing, Separation.**

21 *Except for cold plates that are constructed integrally with an*  
22 *ice storage bin,* BEVERAGE tubing and cold-plate BEVERAGE  
23 cooling devices shall not be installed in contact with stored  
24 ice.

25 **4-204.17 Ice Units, Separation of Drains.**

26 Liquid waste drain lines shall not pass through an ice machine  
27 or ice storage bin.

28 **4-204.18 Condenser Unit, Separation.**

29 If a condenser unit is an integral component of EQUIPMENT, the  
30 condenser unit shall be separated from the FOOD and FOOD

1 storage space by a dustproof barrier.

2 **4-204.19 Can Openers on Vending Machines.**

3 Cutting or piercing parts of can openers on VENDING MACHINES  
4 shall be protected from manual contact, dust, insects, rodents,  
5 and other contamination.

6 **4-204.110 Molluscan Shellfish Tanks.**

7 (A) Except as specified under ¶ (B) of this section,  
8 MOLLUSCAN SHELLFISH life support system display tanks  
9 shall not be used to display shellfish that are offered for  
10 human consumption and shall be conspicuously marked  
11 so that it is obvious to the CONSUMER that the shellfish  
12 are for display only.

13 (B) MOLLUSCAN SHELLFISH life-support system display tanks that  
14 are used to store and display shellfish that are offered for  
15 human consumption shall be operated and maintained in  
16 accordance with a VARIANCE granted by the REGULATORY  
17 AUTHORITY as specified in § 8-103.10 and a HACCP PLAN  
18 that:

19 (1) Is submitted by the PERMIT HOLDER and APPROVED as  
20 specified under § 8-103.11; and

21 (2) Ensures that:

22 (a) Water used with FISH other than MOLLUSCAN  
23 SHELLFISH does not flow into the molluscan  
24 tank,

25 (b) The safety and quality of the shellfish as  
26 they were received are not compromised  
27 by the use of the tank, and

28 (c) The identity of the source of the SHELLSTOCK  
29 is retained as specified under § 3-203.12.

30 **4-204.111 Vending Machines, Automatic Shutoff.\***

1 (A) A machine vending POTENTIALLY HAZARDOUS FOOD  
2 (TIME/TEMPERATURE CONTROL FOR SAFETY FOOD) shall have an  
3 automatic control that prevents the machine from vending  
4 FOOD:

5 (1) If there is a power failure, mechanical failure, or  
6 other condition that results in an internal machine  
7 temperature that cannot maintain FOOD  
8 temperatures as specified under Chapter 3; and

9 (2) If a condition specified under Subparagraph (A)(1)  
10 of this section occurs, until the machine is  
11 serviced and restocked with FOOD that has been  
12 maintained at temperatures specified under  
13 Chapter 3.

14 (B) When the automatic shutoff within a machine vending  
15 potentially hazardous food (time/temperature control for  
16 safety food) is activated:

17 (1) In a refrigerated vending machine, the ambient air  
18 temperature shall not exceed 5°C (41°F) for more  
19 than 30 minutes immediately after the machine is  
20 filled, serviced, or restocked; or

21 (2) In a hot holding vending machine, the ambient air  
22 temperature shall not be less than 57°C (135°F)  
23 for more than 120 minutes immediately after the  
24 machine is filled, serviced, or restocked.

25 **4-204.112 Temperature Measuring Devices.**

26 (A) In a mechanically refrigerated or hot FOOD storage unit,  
27 the sensor of a TEMPERATURE MEASURING DEVICE shall be  
28 located to measure the air temperature or a simulated  
29 product temperature in the warmest part of a mechanically  
30 refrigerated unit and in the coolest part of a hot FOOD

1 storage unit.

2 (B) Except as specified in ¶ (C) of this section, cold or hot  
3 holding EQUIPMENT used for POTENTIALLY HAZARDOUS FOOD  
4 (TIME/TEMPERATURE CONTROL FOR SAFETY FOOD) shall be  
5 designed to include and shall be equipped with at least  
6 one integral or permanently affixed TEMPERATURE MEASURING  
7 DEVICE that is located to allow easy viewing of the  
8 device's temperature display.

9 (C) *Paragraph (B) of this section does not apply to EQUIPMENT*  
10 *for which the placement of a TEMPERATURE MEASURING DEVICE*  
11 *is not a practical means for measuring the ambient air*  
12 *surrounding the FOOD because of the design, type, and*  
13 *use of the EQUIPMENT, such as cal rod units, heat lamps,*  
14 *cold plates, bainmaries, steam tables, insulated FOOD*  
15 *transport containers, and salad bars.*

16 (D) TEMPERATURE MEASURING DEVICES shall be designed to be  
17 easily readable.

18 (E) FOOD TEMPERATURE MEASURING DEVICES and water TEMPERATURE  
19 MEASURING DEVICES ON WAREWASHING machines shall have  
20 a numerical scale, printed record, or digital readout in  
21 increments no greater than 1°C or 2°F in the intended  
22 range of use.

23 **4-204.113 Warewashing Machine, Data Plate Operating**  
24 **Specifications.**

25 A WAREWASHING machine shall be provided with an easily  
26 accessible and readable data plate affixed to the machine by  
27 the manufacturer that indicates the machine's design and  
28 operation specifications including the:

29 (A) Temperatures required for washing, rinsing, and  
30 SANITIZING;

1 (B) Pressure required for the fresh water SANITIZING rinse  
2 *unless the machine is designed to use only a pumped*  
3 *SANITIZING rinse; and*

4 (C) Convey or speed for convey or machines or cycle time  
5 for stationary rack machines.

6 **4-204.114 Warewashing Machines, Internal Baffles.**

7 WAREWASHING machine wash and rinse tanks shall be  
8 equipped with baffles, curtains, or other means to minimize  
9 internal cross contamination of the solutions in wash and rinse  
10 tanks.

11 **4-204.115 Warewashing Machines, Temperature Measuring**  
12 **Devices.**

13 A WAREWASHING machine shall be equipped with a TEMPERATURE  
14 MEASURING DEVICE that indicates the temperature of the water:

15 (A) In each wash and rinse tank; and

16 (B) As the water enters the hot water SANITIZING final rinse  
17 manifold or in the chemical SANITIZING solution tank.

18 **4-204.116 Manual Warewashing Equipment, Heaters and**  
19 **Baskets.**

20 If hot water is used for SANITIZATION in manual WAREWASHING  
21 operations, the SANITIZING compartment of the sink shall be:

22 (A) Designed with an integral heating device that is capable  
23 of maintaining water at a temperature not less than  
24 77°C (171°F); and

25 (B) Provided with a rack or basket to allow complete  
26 immersion of equipment and utensils into the hot  
27 water.

28 **4-204.117 Warewashing Machines, Automatic Dispensing of**  
29 **Detergents and Sanitizers.**

30 A WAREWASHING machine that is installed after adoption of this

1 Code by the REGULATORY AUTHORITY, shall be equipped to:

2 (A) Automatically dispense detergents and SANITIZERS; and

3 (B) Incorporate a visual means to verify that detergents and  
4 SANITIZERS are delivered or a visual or audible alarm to  
5 signal if the detergents and SANITIZERS are not delivered  
6 to the respective washing and SANITIZING cycles.

7 **4-204.118 Warewashing Machines, Flow Pressure Device.**

8 (A) WAREWASHING machines that provide a fresh hot water  
9 SANITIZING rinse shall be equipped with a pressure gauge  
10 or similar device such as a transducer that measures  
11 and displays the water pressure in the supply line  
12 immediately before entering the WAREWASHING machine;  
13 and

14 (B) If the flow pressure measuring device is upstream of the  
15 fresh hot water SANITIZING rinse control valve, the device  
16 shall be mounted in a 6.4 millimeter or one-fourth inch  
17 Iron Pipe Size (IPS) valve.

18 (C) *Paragraphs (A) and (B) of this section do not apply to a*  
19 *machine that uses only a pumped or recirculated*  
20 *SANITIZING rinse.*

21 **4-204.119 Warewashing Sinks and Drain boards, Self Draining.**

22 Sinks and drain boards of WAREWASHING sinks and machines  
23 shall be self-draining.

24 **4-204.120 Equipment Compartments, Drainage.**

25 EQUIPMENT compartments that are subject to accumulation of moisture  
26 due to conditions such as condensation, FOOD or BEVERAGE drip,  
27 or water from melting ice shall be sloped to an outlet that  
28 allows complete draining.

29 **4-204.121 Vending Machines, Liquid Waste Products.**

30 (A) VENDING MACHINES designed to store BEVERAGES that are

1           PACKAGED in containers made from paper products shall  
2           be equipped with diversion devices and retention pans  
3           or drains for container leakage.

4           (B) VENDING MACHINES that dispense liquid FOOD in bulk  
5           shall be:

6           (1) Provided with an internally mounted waste  
7           receptacle for the collection of drip, spillage,  
8           overflow, or other internal wastes; and

9           (2) Equipped with an automatic shutoff device that  
10          will place the machine out of operation before the  
11          waste receptacle overflows.

12          (C) Shutoff devices specified under Subparagraph (B)(2) of  
13          this section shall prevent water or liquid FOOD from  
14          continuously running if there is a failure of a flow  
15          control device in the water or liquid FOOD system or  
16          waste accumulation that could lead to overflow of the  
17          waste receptacle.

18           **4-204.122 Case Lot Handling Apparatuses, Moveability.**

19           Apparatuses, such as dollies, pallets, racks, and skids used  
20           to store and transport large quantities of PACKAGED FOODS  
21           received from a supplier in a cased or overwrapped lot, shall  
22           be designed to be moved by hand or by conveniently  
23           available apparatuses such as hand trucks and forklifts.

24           **4-204.123 Vending Machine Doors and Openings.**

25           (A) VENDING MACHINE doors and access opening covers to FOOD  
26           and container storage spaces shall be tight-fitting so  
27           that the space along the entire interface between the  
28           doors or covers and the cabinet of the machine, if the  
29           doors or covers are in a closed position, is no greater  
30           than 1.5 millimeters or one-sixteenth inch by:

1 (1) Being covered with louvers, screens, or  
 2 materials that provide an equivalent opening of  
 3 not greater than 1.5 millimeters or one-sixteenth  
 4 inch. Screening of 12 or more mesh to 2.5  
 5 centimeters (12 mesh to 1 inch) meets this  
 6 requirement;

7 (2) Being effectively gasketed;

8 (3) Having interface surfaces that are at least 13  
 9 millimeters or one-half inch wide; or

10 (4) Jamb or surfaces used to form an L-shaped entry  
 11 path to the interface.

12 (B) VENDING MACHINE service connection openings through  
 13 an exterior wall of a machine shall be closed by  
 14 sealants, clamps, or grommets so that the openings  
 15 are no larger than 1.5 millimeters or one-sixteenth inch.

16 ***Acceptability*** **4-205.10 Food Equipment, Certification and Classification.**

17 FOOD EQUIPMENT that is certified or classified for sanitation by  
 18 an American National Standards Institute (ANSI) accredited  
 19 certification program is deemed to comply with Parts 4-1 and  
 20 4-2 of this chapter.

21 **4-3 NUMBERS AND CAPACITIES**

22 ***Subparts***

23 **4-301 Equipment**

24 **4-302 Utensils, Temperature Measuring Devices, and**  
 25 **Testing Devices**

26  
 27 ***Equipment*** **4-301.11 Cooling, Heating, and Holding Capacities.**

28 EQUIPMENT for cooling and heating FOOD, and holding cold and  
 29 hot FOOD, shall be sufficient in number and capacity to  
 30 provide FOOD temperatures as specified under Chapter 3.

1                   **4-301.12    Manual    Warewashing,    Sink    Compartment**  
2   **Requirements.**

3           (A)    Except as specified in ¶ (C) of this section, a sink with  
4                   at least 3 compartments shall be provided for manually  
5                   washing, rinsing, and SANITIZING EQUIPMENT and UTENSILS.

6           (B)    Sink compartments shall be large enough to  
7                   accommodate immersion of the largest EQUIPMENT and  
8                   UTENSILS. If EQUIPMENT or UTENSILS are too large for the  
9                   WAREWASHING sink, a WAREWASHING machine or alternative  
10                  EQUIPMENT as specified in ¶ (C) of this section shall be  
11                  used.

12          (C)    *Alternative manual WAREWASHING EQUIPMENT may be used*  
13                  *when there are special cleaning needs or constraints*  
14                  *and its use is APPROVED. Alternative manual*  
15                  *WAREWASHING EQUIPMENT may include:*

16                  (1)    *High-pressure detergent sprayers;*

17                  (2)    *Low- or line-pressure spray detergent foamers;*

18                  (3)    *Other task-specific cleaning EQUIPMENT;*

19                  (4)    *Brushes or other implements;*

20                  (5)    *2-compartment sinks as specified under ¶¶ (D) and*  
21                  *(E) of this section; or*

22                  (6)    *Receptacles that substitute for the compartments*  
23                  *of a multicompartment sink.*

24          (D)    Before a 2-compartment sink is used:

25                  (1)    The PERMIT HOLDER shall have its use APPROVED; and

26                  (2)    The PERMIT HOLDER shall limit the number of  
27                   KITCHENWARE items cleaned and SANITIZED in the  
28                   2-compartment sink, and shall limit WAREWASHING to  
29                   batch operations for cleaning KITCHENWARE such  
30                   as between cutting one type of raw MEAT and

1 another or cleanup at the end of a shift, and  
2 shall:

3 (a) Make up the cleaning and SANITIZING solutions  
4 immediately before use and drain them  
5 immediately after use, and

6 (b) Use a detergent-SANITIZER to SANITIZE and  
7 apply the detergent-SANITIZER in accordance with  
8 the manufacturer's label instructions and as  
9 specified under § 4-501.115, or

10 (c) Use a hot water SANITIZATION immersion step as  
11 specified under ¶ 4-603.16(C).

12 (E) A 2-compartment sink shall not be used for WAREWASHING  
13 operations where cleaning and SANITIZING solutions are used  
14 for a continuous or intermittent flow of KITCHENWARE or  
15 TABLEWARE in an ongoing WAREWASHING process.

16 **4-301.13 Drain boards.**

17 Drain boards, UTENSIL racks, or tables large enough to  
18 accommodate all soiled and cleaned items that may  
19 accumulate during hours of operation shall be provided for  
20 necessary UTENSIL holding before cleaning and after SANITIZING.

21 **4-301.14 Ventilation Hood Systems, Adequacy.**

22 Ventilation hood systems and devices shall be sufficient in  
23 number and capacity to prevent grease or condensation from  
24 collecting on walls and ceilings.

25 **4-301.15 Clothes Washers and Dryers.**

26 (A) Except as specified in ¶ (B) of this section, if work  
27 clothes or LINENS are laundered on the PREMISES, a  
28 mechanical clothes washer and dryer shall be provided  
29 and used.

30 (B) *If on-PREMISES laundering is limited to wiping cloths intended*

1                   to be used moist, or wiping cloths are air-dried as  
2                   specified under § 4-901.12, a mechanical clothes washer  
3                   and dryer need not be provided.

4   **Utensils,           4-302.11    Utensils, Consumer Self-Service.**

5   **Temperature**       A FOOD dispensing UTENSIL shall be available for each  
6  
7   **Measuring**        container displayed at a CONSUMER self-service unit such as a  
8   **Devices,**           buffet or salad bar.

9   **and Testing**

10 **Devices**

11                   **4-302.12    Food Temperature Measuring Devices.**

12           (A)   FOOD TEMPERATURE MEASURING DEVICES shall be  
13           provided and readily accessible for use in ensuring  
14           attainment and maintenance of FOOD temperatures as  
15           specified under Chapter 3.

16           (B)   A TEMPERATURE MEASURING DEVICE with a suitable small-  
17           diameter probe that is designed to measure the  
18           temperature of thin masses shall be provided and  
19           readily accessible to accurately measure the temperature  
20           in thin FOODS such as MEAT patties and FISH filets.

21                   **4-302.13    Temperature Measuring Devices, Manual**  
22                   **Warewashing.**

23           In manual WAREWASHING operations, a TEMPERATURE MEASURING DEVICE  
24           shall be provided and readily accessible for frequently measuring the  
25           washing and SANITIZING temperatures.

26                   **4-302.14    Sanitizing Solutions, Testing Devices.**

27           A test kit or other device that accurately measures the  
28           concentration in MG/L of SANITIZING solutions shall be  
29           provided.

30

1 4-4 LOCATION AND INSTALLATION

2 **Subparts**

3 4-401 Location

4 4-402 Installation

5  
6 **Location 4-401.11 Equipment, Clothes Washers and Dryers, and**  
7 **Storage Cabinets, Contamination Prevention.**

8 (A) Except as specified in ¶ (B) of this section, EQUIPMENT, a  
9 cabinet used for the storage of FOOD, or a cabinet that  
10 is used to store cleaned and SANITIZED EQUIPMENT, UTENSILS,  
11 laundered LINENS, and SINGLE-SERVICE and SINGLE-USE  
12 ARTICLES shall not be located:

- 13 (1) In locker rooms;
- 14 (2) In toilet rooms;
- 15 (3) In garbage rooms;
- 16 (4) In mechanical rooms;
- 17 (5) Under sewer lines that are not shielded to
- 18 intercept potential drips;
- 19 (6) Under leaking water lines including leaking
- 20 automatic fire sprinkler heads or under lines on
- 21 which water has condensed;
- 22 (7) Under open stairwells; or
- 23 (8) Under other sources of contamination.

24 (B) *A storage cabinet used for LINENS or SINGLE-SERVICE or SINGLE-*  
25 *USE ARTICLES may be stored in a locker room.*

26 (C) If a mechanical clothes washer or dryer is provided, it  
27 shall be located so that the washer or dryer is  
28 protected from contamination and only where there is no  
29 exposed FOOD; clean EQUIPMENT, UTENSILS, and LINENS;  
30 and unwrapped SINGLE-SERVICE and SINGLE-USE ARTICLES.

1 **Installation****4-402.11 Fixed Equipment, Spacing or Sealing.**

2 (A) EQUIPMENT that is fixed because it is not EASILY MOVABLE  
3 shall be installed so that it is:

4 (1) Spaced to allow access for cleaning along the  
5 sides, behind, and above the EQUIPMENT;

6 (2) Spaced from adjoining EQUIPMENT, walls, and  
7 ceilings a distance of not more than 1 millimeter  
8 or one thirty-second inch; or

9 (3) SEALED to adjoining EQUIPMENT or walls, if the EQUIPMENT  
10 is exposed to spillage or seepage.

11 (B) COUNTER-MOUNTED EQUIPMENT that is not EASILY MOVABLE  
12 shall be installed to allow cleaning of the EQUIPMENT and  
13 areas underneath and around the EQUIPMENT by being:

14 (1) SEALED; or

15 (2) Elevated on legs as specified under ¶ 4-402.12(D).

**4-402.12 Fixed Equipment, Elevation or Sealing.**

17 (A) Except as specified in ¶¶ (B) and (C) of this section,  
18 floor-mounted EQUIPMENT that is not EASILY MOVABLE shall  
19 be SEALED to the floor or elevated on legs that provide  
20 at least a 15 centimeter (6 inch) clearance between the  
21 floor and the EQUIPMENT.

22 (B) *If no part of the floor under the floor-mounted EQUIPMENT*  
23 *is more than 15 centimeters (6 inches) from the point of*  
24 *cleaning access, the clearance space may be only 10*  
25 *centimeters (4 inches).*

26 (C) *This section does not apply to display shelving units, display*  
27 *refrigeration units, and display freezer units located in the*  
28 *CONSUMER shopping areas of a retail FOOD store, if the*  
29 *floor under the units is maintained clean.*

30 (D) Except as specified in ¶ (E) of this section, COUNTER-

1 MOUNTED EQUIPMENT that is not EASILY MOVABLE shall be  
 2 elevated on legs that provide at least a 10 centimeter (4  
 3 inch) clearance between the table and the EQUIPMENT.

4 (E) *The clearance space between the table and COUNTER-*  
 5 *MOUNTED EQUIPMENT may be:*

6 (1) *7.5 centimeters (3 inches) if the horizontal*  
 7 *distance of the table top under the EQUIPMENT is no*  
 8 *more than 50 centimeters (20 inches) from the*  
 9 *point of access for cleaning; or*

10 (2) *5 centimeters (2 inches) if the horizontal distance*  
 11 *of the table top under the EQUIPMENT is no more*  
 12 *than 7.5 centimeters (3 inches ) from the point of*  
 13 *access for cleaning.*

14  
 15 **4-5 MAINTENANCE AND OPERATION**

16 ***Subparts***

17 **4-501 Equipment**

18 **4-502 Utensils and Temperature and Pressure**

19 **Measuring Devices**

20  
 21 ***Equipment* 4-501.11 Good Repair and Proper Adjustment.**

22 (A) EQUIPMENT shall be maintained in a state of repair and  
 23 condition that meets the requirements specified under  
 24 Parts 4-1 and 4-2.

25 (B) EQUIPMENT components such as doors, seals, hinges,  
 26 fasteners, and kick plates shall be kept intact, tight, and  
 27 adjusted in accordance with manufacturer's  
 28 specifications.

1 (C) Cutting or piercing parts of can openers shall be kept  
2 sharp to minimize the creation of metal fragments that  
3 can contaminate FOOD when the container is opened.

4 **4-501.12 Cutting Surfaces.**

5 Surfaces such as cutting blocks and boards that are  
6 subject to scratching and scoring shall be resurfaced if they  
7 can no longer be effectively cleaned and SANITIZED, or  
8 discarded if they are not capable of being resurfaced.

9 **4-501.13 Microwave Ovens.**

10 Microwave ovens shall meet the safety standards specified in  
11 21 CFR 1030.10 Microwave ovens.

12 **4-501.14 Warewashing Equipment, Cleaning Frequency.**

13 A WAREWASHING machine; the compartments of sinks, basins,  
14 or other receptacles used for washing and rinsing EQUIPMENT,  
15 UTENSILS, or raw FOODS, or laundering wiping cloths; and drain  
16 boards or other EQUIPMENT used to substitute for drain boards  
17 as specified under § 4-301.13 shall be cleaned:

18 (A) Before use;

19 (B) Throughout the day at a frequency necessary to  
20 prevent recontamination of EQUIPMENT and UTENSILS and  
21 to ensure that the EQUIPMENT performs its intended  
22 function; and

23 (C) If used, at least every 24 hours.

24 **4-501.15 Warewashing Machines, Manufacturers'**  
25 **Operating Instructions.**

26 (A) A WAREWASHING machine and its auxiliary components  
27 shall be operated in accordance with the machine's data  
28 plate and other manufacturer's instructions.

29 (B) A WAREWASHING machine's conveyor speed or automatic  
30 cycle times shall be maintained accurately timed in

1 accordance with manufacturer's specifications.

2 **4-501.16 Warewashing Sinks, Use Limitation.**

3 (A) A WAREWASHING sink shall not be used for handwashing  
4 as specified under § 2-301.15.

5 (B) If a WAREWASHING sink is used to wash wiping cloths,  
6 wash produce, or thaw FOOD, the sink shall be cleaned  
7 as specified under § 4-501.14 before and after each  
8 time it is used to wash wiping cloths or wash produce  
9 or thaw FOOD. Sinks used to wash or thaw FOOD shall  
10 be SANITIZED as specified under Part 4-7 before and  
11 after using the sink to wash produce or thaw FOOD.

12 **4-501.17 Warewashing Equipment, Cleaning Agents.**

13 When used for WAREWASHING, the wash compartment of a sink,  
14 mechanical warewasher, or wash receptacle of alternative  
15 manual WAREWASHING EQUIPMENT as specified in ¶ 4-301.12(C),  
16 shall contain a wash solution of soap, detergent, acid  
17 cleaner, alkaline cleaner, degreaser, abrasive cleaner, or other  
18 cleaning agent according to the cleaning agent manufacturer's  
19 label instructions.

20 **4-501.18 Warewashing Equipment, Clean Solutions.**

21 The wash, rinse, and SANITIZE solutions shall be maintained  
22 clean.

23 **4-501.19 Manual Warewashing Equipment, Wash Solution  
24 Temperature.**

25 The temperature of the wash solution in manual WAREWASHING  
26 EQUIPMENT shall be maintained at not less than 43°C (110°F)  
27 or the temperature specified on the cleaning agent  
28 manufacturer's label instructions.

29 **4-501.110 Mechanical Warewashing Equipment, Wash  
30 Solution Temperature.**

1 A) The temperature of the wash solution in spray type  
2 warewashers that use hot water to SANITIZE shall not  
3 be less than:

4 (1) For a stationary rack, single temperature machine,  
5 74°C (165°F);

6 (2) For a stationary rack, dual temperature machine,  
7 66°C (150°F);

8 (3) For a single tank, conveyor, dual temperature  
9 machine, 71°C (160°F); or

10 (4) For a multitank, conveyor, multitemperature  
11 machine, 66°C (150°F).

12 (B) The temperature of the wash solution in spray-type  
13 warewashers that use chemicals to SANITIZE shall not  
14 be less than 49°C (120°F).

15 **4-501.111 Manual Warewashing Equipment, Hot Water**  
16 **Sanitization Temperatures.\***

17 If immersion in hot water is used for SANITIZING in a manual  
18 operation, the temperature of the water shall be maintained  
19 at 77°C (171°F) or above.

20 **4-501.112 Mechanical Warewashing Equipment, Hot Water**  
21 **Sanitization Temperatures.**

22 (A) Except as specified in ¶(B) of this section, in a  
23 mechanical operation, the temperature of the fresh hot  
24 water SANITIZING rinse as it enters the manifold shall not  
25 be more than 90°C, (194°F), or less than:

26 (1) For a stationary rack, single temperature machine,  
27 74°C (165°F); or

28 (2) For all other machines, 82°C (180°F).

29 (B) *The maximum temperature specified under ¶ (A) of this*  
30 *section, does not apply to the high pressure and*

1 *temperature systems with wand-type, hand-held, spraying*  
 2 *devices used for the in-place cleaning and SANITIZING of*  
 3 *EQUIPMENT such as meat saws.*

4 **4-501.113 Mechanical Warewashing Equipment, Sanitization**  
 5 **Pressure.**

6 The flow pressure of the fresh hot water SANITIZING rinse in a  
 7 WAREWASHING machine, as measured in the water line immediately  
 8 downstream or upstream from the fresh hot water SANITIZING rinse  
 9 control value, shall be within the range specified on the  
 10 machine manufacturer's data plate and shall not be less than  
 11 35 kilopascals (5 pounds per square inch) or more than 200  
 12 kilopascals (30 pounds per square inch).

13 **4-501.114 Manual and Mechanical Warewashing Equipment,**  
 14 **Chemical Sanitization - Temperature, pH,**  
 15 **Concentration, and Hardness.\***

16 A chemical SANITIZER used in a SANITIZING solution for a  
 17 manual or mechanical operation at exposure times specified  
 18 under ¶ 4-703.11(C) shall meet the criteria specified under  
 19 § 7-204.11 Sanitizers, Criteria, shall be used in accordance  
 20 with the EPA-approved manufacturer's label use instructions,  
 21 and shall be used as follows:

22 (A) A chlorine solution shall have a minimum temperature  
 23 based on the concentration and pH of the solution as  
 24 listed in the following chart;

Minimum Concentration	Minimum Temperature	
MG/L	PH 10 or less	PH 8 or less
	°C (°F)	°C (°F)

1			
2	25	49 (120)	49 (120)
3	50	38 (100)	24 ( 75)
4	100	13 ( 55)	13 ( 55)
5			

6 (B) An iodine solution shall have a:

- 7 (1) Minimum temperature of 24°C (75°F),
- 8 (2) PH of 5.0 or less or a PH no higher than the
- 9 level for which the manufacturer specifies the solution
- 10 is effective, and
- 11 (3) Concentration between 12.5 MG/L and 25 MG/L;

12 (C) A quaternary ammonium compound solution shall:

- 13 (1) Have a minimum temperature of 24°C (75°F),
- 14 (2) Have a concentration as specified under §
- 15 7-204.11 and as indicated by the manufacturer's
- 16 use directions included in the labeling, and
- 17 (3) Be used only in water with 500 MG/L hardness or
- 18 less or in water having a hardness no greater
- 19 than specified by the manufacturer's label;

20 (D) If another solution of a chemical specified under

21 ¶¶ (A) (C) of this section is used, the PERMIT HOLDER shall

22 demonstrate to the REGULATORY AUTHORITY that the solution

23 achieves SANITIZATION and the use of the solution shall

24 be APPROVED; or

25 (E) If a chemical SANITIZER other than chlorine, iodine, or a

26 quaternary ammonium compound is used, it shall be

27 applied in accordance with the manufacturer's use

28 directions included in the labeling.

29 **4-501.115 Manual Warewashing Equipment, Chemical**

30 **Sanitization Using Detergent-Sanitizers.**

1 If a detergent-SANITIZER is used to SANITIZE in a cleaning and  
 2 SANITIZING procedure where there is no distinct water rinse  
 3 between the washing and SANITIZING steps, the agent applied  
 4 in the SANITIZING step shall be the same detergent-SANITIZER that  
 5 is used in the washing step.

6 **4-501.116 Warewashing Equipment, Determining**  
 7 **Chemical Sanitizer Concentration.**

8 Concentration of the SANITIZING solution shall be accurately  
 9 determined by using a test kit or other device.

10 ***Utensils and***  
 11 ***Temperature***  
 12 ***and Pressure***  
 13 ***Measuring***  
 14 ***Devices***

15 **4-502.11 Good Repair and Calibration.**

16 (A) UTENSILS shall be maintained in a state of repair or  
 17 condition that complies with the requirements specified  
 18 under Parts 4-1 and 4-2 or shall be discarded.

19 (B) FOOD TEMPERATURE MEASURING DEVICES shall be calibrated in  
 20 accordance with manufacturer's specifications as necessary  
 21 to ensure their accuracy.

22 (C) Ambient air temperature, water pressure, and water  
 23 TEMPERATURE MEASURING DEVICES shall be maintained in  
 24 good repair and be accurate within the intended  
 25 range of use.

26 **4-502.12 Single-Service and Single-Use Articles, Required**  
 27 **Use.\***

28 A FOOD ESTABLISHMENT without facilities specified under Parts  
 29 4-6 and 4-7 for cleaning and SANITIZING KITCHENWARE and  
 30 TABLEWARE shall provide only SINGLE-USE KITCHENWARE, SINGLE-  
 SERVICE ARTICLES, and SINGLE-USE ARTICLES for use by FOOD EMPLOYEES  
 AND SINGLE-SERVICE ARTICLES for use by CONSUMERS.

**4-502.13 Single-Service and Single-Use Articles, Use**  
**Limitation.**

(A) SINGLE-SERVICE and SINGLE-USE ARTICLES shall not be

1 reused.

2 (B) The bulk milk container dispensing tube shall be cut  
3 on the diagonal leaving no more than one inch  
4 protruding from the chilled dispensing head.

5 **4-502.14 Shells, Use Limitation.**

6 Mollusk and crustacea shells shall not be used more than  
7 once as serving containers.

8  
9 **4-6 CLEANING OF EQUIPMENT AND UTENSILS**

10 ***Subparts***

11 **4-601 Objective**

12 **4-602 Frequency**

13 **4-603 Methods**

14  
15 ***Objective*** **4-601.11 Equipment, Food-Contact Surfaces, Nonfood-**  
16 **Contact Surfaces, and Utensils.\***

17 (A) EQUIPMENT FOOD-CONTACT SURFACES and UTENSILS shall be  
18 clean to sight and touch.

19 (B) The FOOD-CONTACT SURFACES of cooking EQUIPMENT and  
20 pans shall be kept free of encrusted grease deposits  
21 and other soil accumulations.<sup>N</sup>

22 (C) NonFOOD-CONTACT SURFACES of EQUIPMENT shall be kept  
23 free of an accumulation of dust, dirt, FOOD residue, and  
24 other debris.<sup>N</sup>

25 ***Frequency*** **4-602.11 Equipment Food-Contact Surfaces and**  
26 **Utensils.\***

27 (A) EQUIPMENT FOOD-CONTACT SURFACES and UTENSILS shall be  
28 cleaned:

29 (1) Except as specified in ¶ (B) of this section, before  
30 each use with a different type of raw animal FOOD

- 1 such as beef, FISH, lamb, pork, or POULTRY;
- 2 (2) Each time there is a change from working with
- 3 raw FOODS to working with READY-TO-EAT FOODS;
- 4 (3) Between uses with raw fruits and vegetables
- 5 and with POTENTIALLY HAZARDOUS FOOD
- 6 (TIME/TEMPERATURE CONTROL FOR SAFETY FOOD);
- 7 (4) Before using or storing a FOOD TEMPERATURE MEASURING
- 8 DEVICE; and
- 9 (5) At any time during the operation when
- 10 contamination may have occurred.
- 11 (B) *Subparagraph (A)(1) of this section does not apply if the*
- 12 *FOOD-CONTACT SURFACE or UTENSIL is in contact with a*
- 13 *succession of different raw animal FOODS each requiring*
- 14 *a higher cooking temperature as specified under*
- 15 *§3-401.11 than the previous FOOD, such as preparing*
- 16 *raw FISH followed by cutting raw poultry on the same*
- 17 *cutting board.*
- 18 (C) Except as specified in ¶ (D) of this section, if used with
- 19 POTENTIALLY HAZARDOUS FOOD (TIME/TEMPERATURE CONTROL
- 20 FOR SAFETY FOOD), EQUIPMENT FOOD-CONTACT SURFACES and
- 21 UTENSILS shall be cleaned throughout the day at least
- 22 every 4 hours.
- 23 (D) *Surfaces of UTENSILS and EQUIPMENT contacting POTENTIALLY*
- 24 *HAZARDOUS FOOD (TIME/TEMPERATURE CONTROL FOR SAFETY*
- 25 *FOOD) may be cleaned less frequently than every 4 hours*
- 26 *if:*
- 27 (1) *In storage, containers of POTENTIALLY HAZARDOUS*
- 28 *FOOD (TIME/TEMPERATURE CONTROL FOR SAFETY FOOD) and*
- 29 *their contents are maintained at temperatures specified*
- 30 *under Chapter 3 and the containers are cleaned*

1 *when they are empty;*

2 (2) *UTENSILS and EQUIPMENT are used to prepare FOOD*  
 3 *in a refrigerated room or area that is maintained at*  
 4 *one of the temperatures in the following chart and:*

5  
 6 (a) *The UTENSILS and EQUIPMENT are cleaned at*  
 7 *the frequency in the following chart that*  
 8 *corresponds to the temperature; and*

Temperature	Cleaning
Frequency	
5.0°C (41°F) or less	24 hours
>5.0°C - 7.2°C	20 hours
(>41°F - 45°F)	
>7.2°C - 10.0°C	16 hours
(>45°F - 50°F)	
>10.0°C - 12.8°C	10 hours
(>50°F - 55°F)	

9  
 10

 13  
 14  
 15  
 16  
 17  
 18  
 19  
 20  
 21  
 22 (b) *The cleaning frequency based on the*  
 23 *ambient temperature of the refrigerated room*  
 24 *or area is documented in the FOOD*  
 25 *ESTABLISHMENT.*

26 (3) *Containers in serving situations such as salad*  
 27 *bars, delis, and cafeteria lines hold READY-TO-EAT*  
 28 *POTENTIALLY HAZARDOUS FOOD (TIME/TEMPERATURE*  
 29 *CONTROL FOR SAFETY FOOD) that is maintained at*  
 30 *the temperatures specified under Chapter 3, are*

1 *intermittently combined with additional supplies of*  
2 *the same FOOD that is at the required temperature,*  
3 *and the containers are cleaned at least every 24*  
4 *hours;*

5 (4) *TEMPERATURE MEASURING DEVICES are maintained in*  
6 *contact with FOOD, such as when left in a container*  
7 *of deli FOOD or in a roast, held at temperatures*  
8 *specified under Chapter 3;*

9 (5) *EQUIPMENT is used for storage of PACKAGED or*  
10 *unpacked FOOD such as a reach-in refrigerator*  
11 *and the EQUIPMENT is cleaned at a frequency*  
12 *necessary to preclude accumulation of soil*  
13 *residues;*

14 (6) *The cleaning schedule is APPROVED based on*  
15 *consideration of:*

16 (a) *Characteristics of the EQUIPMENT and its use,*

17 (b) *The type of FOOD involved,*

18 (c) *The amount of FOOD residue accumulation,*  
19 *and*

20 (d) *The temperature at which the FOOD is*  
21 *maintained during the operation and the potential*  
22 *for the rapid and progressive multiplication of*  
23 *pathogenic or toxigenic microorganisms that are*  
24 *capable of causing foodborne disease; or*

25 (7) *In-use UTENSILS are intermittently stored in a*  
26 *container of water in which the water is maintained*  
27 *at 57°C (135°F) or more and the UTENSILS and*  
28 *container are cleaned at least every 24 hours*  
29 *or at a frequency necessary to preclude*  
30 *accumulation of soil residues.*

1 (E) *Except when dry cleaning methods are used as*  
2 *specified under § 4-603.11, surfaces of UTENSILS and*  
3 *EQUIPMENT contacting FOOD that is not POTENTIALLY HAZARDOUS*  
4 *(TIME/TEMPERATURE CONTROL FOR SAFETY FOOD) shall be*  
5 *cleaned:<sup>N</sup>*

6 (1) At any time when contamination may have  
7 occurred;

8 (2) At least every 24 hours for iced tea dispensers  
9 and CONSUMER self-service UTENSILS such as  
10 tongs, scoops, or ladles;

11 (3) Before restocking CONSUMER self-service EQUIPMENT and  
12 UTENSILS such as condiment dispensers and display  
13 containers; and

14 (4) In EQUIPMENT such as ice bins and BEVERAGE  
15 dispensing nozzles and enclosed components of  
16 EQUIPMENT such as ice makers, cooking oil storage  
17 tanks and distribution lines, BEVERAGE and syrup  
18 dispensing lines or tubes, coffee bean grinders,  
19 and water vending EQUIPMENT:

20 (a) At a frequency specified by the  
21 manufacturer, or

22 (b) Absent manufacturer specifications, at a  
23 frequency necessary to preclude  
24 accumulation of soil or mold.

25 **4-602.12 Cooking and Baking Equipment.**

26 (A) The FOOD-CONTACT SURFACES of cooking and baking  
27 EQUIPMENT shall be cleaned at least every 24 hours.  
28 *This section does not apply to hot oil cooking and*  
29 *filtering EQUIPMENT if it is cleaned as specified in Subparagraph*  
30 *4-602.11(D)(6).*

1 (B) The cavities and door seals of microwave ovens shall  
2 be cleaned at least every 24 hours by using the  
3 manufacturer's recommended cleaning procedure.

4 **4-602.13 Nonfood-Contact Surfaces.**

5 NonFOOD-CONTACT SURFACES of EQUIPMENT shall be cleaned at a  
6 frequency necessary to preclude accumulation of soil residues.

7 **Methods**

8 **4-603.11 Dry Cleaning.**

9 (A) If used, dry cleaning methods such as brushing,  
10 scraping, and vacuuming shall contact only SURFACES  
11 that are soiled with dry FOOD residues that are not  
12 POTENTIALLY HAZARDOUS (TIME/TEMPERATURE CONTROL FOR  
SAFETY FOOD).

13 (B) Cleaning EQUIPMENT used in dry cleaning FOOD-CONTACT  
14 SURFACES may not be used for any other purpose.

15 **4-603.12 Precleaning.**

16 (A) FOOD debris on EQUIPMENT and UTENSILS shall be  
17 scrapped over a waste disposal unit or garbage  
18 receptacle or shall be removed in a WAREWASHING  
19 machine with a prewash cycle.

20 (B) If necessary for effective cleaning, UTENSILS and  
21 EQUIPMENT shall be preflushed, presoaked, or scrubbed  
22 with abrasives.

23 **4-603.13 Loading of Soiled Items, Warewashing**  
24 **Machines.**

25 Soiled items to be cleaned in a WAREWASHING machine shall be  
26 loaded into racks, trays, or baskets or onto conveyors in a  
27 position that:

28 (A) Exposes the items to the unobstructed spray from all  
29 cycles; and

30 (B) Allows the items to drain.

**4-603.14 Wet Cleaning.**

- (A) EQUIPMENT FOOD-CONTACT SURFACES and UTENSILS shall be effectively washed to remove or completely loosen soils by using the manual or mechanical means necessary such as the application of detergents containing wetting agent and emulsifiers; acid, alkaline, or abrasive cleaners; hot water; brushes; scouring pads; high-pressure sprays; or ultrasonic devices.
- (B) The washing procedures selected shall be based on the type and purpose of the EQUIPMENT or UTENSIL, and on the type of soil to be removed.

**4-603.15 Washing, Procedures for Alternative Manual Warewashing Equipment.**

If washing in sink compartments or a WAREWASHING machine is impractical such as when the EQUIPMENT is fixed or the UTENSILS are too large, washing shall be done by using alternative manual WAREWASHING EQUIPMENT as specified in ¶ 4-301.12(C) in accordance with the following procedures:

- (A) EQUIPMENT shall be disassembled as necessary to allow access of the detergent solution to all parts;
- (B) EQUIPMENT components and UTENSILS shall be scrapped or rough cleaned to remove FOOD particle accumulation; and
- (C) EQUIPMENT and UTENSILS shall be washed as specified under ¶ 4-603.14(A).

**4-603.16 Rinsing Procedures.**

Washed UTENSILS and EQUIPMENT shall be rinsed so that abrasives are removed and cleaning chemicals are removed or diluted through the use of water or a detergent-sanitizer solution by using one of the following procedures:

- 1 (A) Use of a distinct, separate water rinse after washing and  
2 before SANITIZING if using:  
3 (1) A 3-compartment sink,  
4 (2) Alternative manual WAREWASHING EQUIPMENT  
5 equivalent to a 3-compartment sink as specified  
6 in ¶ 4-301.12(C), or  
7 (3) A 3-step washing, rinsing, and SANITIZING  
8 procedure in a WAREWASHING system for CIP  
9 EQUIPMENT;
- 10 (B) Use of a detergent-SANITIZER as specified under  
11 § 4-501.115 if using:  
12 (1) Alternative WAREWASHING EQUIPMENT as specified in  
13 ¶ 4-301.12(C) that is APPROVED for use with a  
14 detergent-SANITIZER, or  
15 (2) A WAREWASHING system for CIP EQUIPMENT;
- 16 (C) Use of a nondistinct water rinse that is integrated in the  
17 hot water SANITIZATION immersion step of a 2-compartment  
18 sink operation;
- 19 (D) If using a WAREWASHING machine that does not recycle  
20 the SANITIZING solution as specified under ¶ (E) of this  
21 section, or alternative manual WAREWASHING EQUIPMENT such  
22 as sprayers, use of a nondistinct water rinse that is:  
23 (1) Integrated in the application of the SANITIZING  
24 solution, and  
25 (2) Wasted immediately after each application; or
- 26 (E) If using a WAREWASHING machine that recycles the  
27 SANITIZING solution for use in the next wash cycle, use  
28 of a nondistinct water rinse that is integrated in the  
29 application of the SANITIZING solution.

30 **4-603.17 Returnables, Cleaning for Refilling.\***

- 1 (A) Except as specified in ¶¶ (B) and (C) of this section,  
2 returned empty containers intended for cleaning and  
3 refilling with FOOD shall be cleaned and refilled in a  
4 regulated FOOD PROCESSING PLANT.
- 5 (B) *A FOOD-specific container for BEVERAGES may be refilled*  
6 *at a FOOD ESTABLISHMENT if:*
- 7 (1) *Only a BEVERAGE that is not a POTENTIALLY HAZARDOUS*  
8 *FOOD (TIME/TEMPERATURE CONTROL FOR SAFETY FOOD) is*  
9 *used as specified under ¶ 3-304.17(A);*
- 10 (2) *The design of the container and of the rinsing*  
11 *EQUIPMENT and the nature of the BEVERAGE, when*  
12 *considered together, allow effective cleaning at*  
13 *home or in the FOOD ESTABLISHMENT;*
- 14 (3) *Facilities for rinsing before refilling returned*  
15 *containers with fresh, hot water that is under*  
16 *pressure and not recirculated are provided as*  
17 *part of the dispensing system;*
- 18 (4) *The CONSUMER-owned container returned to the*  
19 *FOOD ESTABLISHMENT for refilling is refilled for sale or*  
20 *service only to the same CONSUMER; and*
- 21 (5) *The container is refilled by:*
- 22 (a) *An EMPLOYEE of the FOOD ESTABLISHMENT, or*  
23 (b) *The owner of the container if the BEVERAGE*  
24 *system includes a contamination-free*  
25 *transfer process that cannot be bypassed*  
26 *by the container owner.*
- 27 (C) *CONSUMER-owned containers that are not FOOD-specific may*  
28 *be filled at a water VENDING MACHINE or system.*

- 4-701 Objective**
- 4-702 Frequency**
- 4-703 Methods**

**Objective 4-701.10 Food-Contact Surfaces and Utensils.**

EQUIPMENT FOOD-CONTACT SURFACES and UTENSILS shall be SANITIZED.

**Frequency 4-702.11 Before Use After Cleaning.\***

UTENSILS and FOOD-CONTACT SURFACES of EQUIPMENT shall be SANITIZED before use after cleaning.

**Methods 4-703.11 Hot Water and Chemical.\***

After being cleaned, EQUIPMENT FOOD-CONTACT SURFACES and UTENSILS shall be SANITIZED in:

- (A) Hot water manual operations by immersion for at least 30 seconds and as specified under § 4-501.111;
- (B) Hot water mechanical operations by being cycled through EQUIPMENT that is set up as specified under §§ 4-501.15, 4-501.112, and 4-501.113 and achieving a UTENSIL surface temperature of 71°C (160°F) as measured by an irreversible registering temperature indicator; or
- (C) Chemical manual or mechanical operations, including the application of SANITIZING chemicals by immersion, manual swabbing, brushing, or pressure spraying methods, using a solution as specified under § 4-501.114 by providing:
  - (1) Except as specified under Subparagraph (C)(2) of this section, an exposure time of at least 10 seconds for a chlorine solution specified under ¶ 4-501.114(A),

- 1 (2) An exposure time of at least 7 seconds for a  
 2 chlorine solution of 50 MG/L that has a pH of 10  
 3 or less and a temperature of at least 38°C (100°F)  
 4 or a pH of 8 or less and a temperature of at  
 5 least 24°C (75°F),  
 6 (3) An exposure time of at least 30 seconds for  
 7 other chemical SANITIZING solutions, or  
 8 (4) An exposure time used in relationship with a  
 9 combination of temperature, concentration, and pH  
 10 that, when evaluated for efficacy, yields  
 11 SANITIZATION as defined in Subparagraph  
 12 1-201.10(B).  
 13

14 **4-8 LAUNDERING**

15 ***Subparts***

16 **4-801 Objective**

17 **4-802 Frequency**

18 **4-803 Methods**

19  
 20 ***Objective*** **4-801.11 Clean Linens.**

21 Clean LINENS shall be free from FOOD residues and other  
 22 soiling matter.

23 ***Frequency*** **4-802.11 Specifications.**

24 (A) LINENS that do not come in direct contact with FOOD  
 25 shall be laundered between operations if they become  
 26 wet, sticky, or visibly soiled.

27 (B) Cloth gloves used as specified in & 3-304.15(D) shall be  
 28 laundered before being used with a different type of raw  
 29 animal FOOD such as beef, FISH, lamb, pork or POULTRY.

30 (C) LINENS and napkins that are used as specified under

1 § 3-304.13 and cloth napkins shall be laundered  
2 between each use.

3 (D) Wet wiping cloths shall be laundered daily.

4 (E) Dry wiping cloths shall be laundered as necessary to  
5 prevent contamination of FOOD and clean serving UTENSILS.  
6

7 **Methods**

8 **4-803.11 Storage of Soiled Linens.**

9 Soiled LINENS shall be kept in clean, nonabsorbent  
10 receptacles or clean, washable laundry bags and stored and  
11 transported to prevent contamination of FOOD, clean  
12 EQUIPMENT, clean UTENSILS, and SINGLE-SERVICE and SINGLE-USE  
ARTICLES.

13 **4-803.12 Mechanical Washing.**

14 (A) Except as specified in ¶ (B) of this section, LINENS  
15 shall be mechanically washed.

16 (B) *In FOOD ESTABLISHMENTS in which only wiping cloths are*  
17 *laundered as specified in ¶ 4-301.15(B), the wiping*  
18 *cloths may be laundered in a mechanical washer, sink*  
19 *designated only for laundering wiping cloths, or a*  
20 *WAREWASHING or FOOD preparation sink that is cleaned*  
21 *as specified under § 4-501.14.*

22 **4-803.13 Use of Laundry Facilities.**

23 (A) Except as specified in ¶ (B) of this section, laundry  
24 facilities on the PREMISES of a FOOD ESTABLISHMENT shall  
25 be used only for the washing and drying of items used  
26 in the operation of the establishment.

27 (B) *Separate laundry facilities located on the PREMISES for the*  
28 *purpose of general laundering such as for institutions*  
29 *providing boarding and lodging may also be used for*  
30 *laundering FOOD ESTABLISHMENT items.*

**4-9 PROTECTION OF CLEAN ITEMS**

***Subparts***

- 4-901 Drying**
- 4-902 Lubricating and Reassembling**
- 4-903 Storing**
- 4-904 Preventing Contamination**

***Drying* 4-901.11 Equipment and Utensils, Air-Drying Required.**

After cleaning and SANITIZING, EQUIPMENT and UTENSILS:

- (A) Shall be air-dried or used after adequate draining as specified in the first paragraph of 40 CFR 180.940 Tolerance exemptions for active and inert ingredients for use in antimicrobial formulations (food-contact surface SANITIZING solutions), before contact with FOOD; and
- (B) Shall not be cloth dried *except that UTENSILS that have been air-dried may be polished with cloths that are maintained clean and dry.*

**4-901.12 Wiping Cloths, Air-Drying Locations.**

Wiping cloths laundered in a FOOD ESTABLISHMENT that does not have a mechanical clothes dryer as specified in ¶ 4-301.15(B) shall be air-dried in a location and in a manner that prevents contamination of FOOD, EQUIPMENT, UTENSILS, LINENS, and SINGLE-SERVICE and SINGLE-USE ARTICLES and the wiping cloths. *This section does not apply if wiping cloths are stored after laundering in a SANITIZING solution as specified under § 4-501.114.*

***Lubricating* 4-902.11 Food-Contact Surfaces.**

***and*** Lubricants as specified under § 7-205.11 shall be applied to

1 **Reassembling** FOOD-CONTACT SURFACES that require lubrication in a manner that  
2 does not contaminate FOOD-CONTACT SURFACES.

3 **4-902.12 Equipment.**

4 EQUIPMENT shall be reassembled so that FOOD-CONTACT  
5 SURFACES are not contaminated.

6 **Storing** **4-903.11 Equipment, Utensils, Linens, and Single-Service  
7 and Single-Use Articles.**

8 (A) Except as specified in ¶ (D) of this section, cleaned  
9 EQUIPMENT and UTENSILS, laundered LINENS, and SINGLE-SERVICE  
10 and SINGLE-USE ARTICLES shall be stored:

11 (1) In a clean, dry location;

12 (2) Where they are not exposed to splash, dust, or  
13 other contamination; and

14 (3) At least 15 cm (6 inches) above the floor.

15 (B) Clean EQUIPMENT and UTENSILS shall be stored as specified  
16 under ¶ (A) of this section and shall be stored:

17 (1) In a self-draining position that allows air drying;  
18 and

19 (2) Covered or inverted.

20 (C) SINGLE-SERVICE and SINGLE-USE ARTICLES shall be stored as  
21 specified under ¶ (A) of this section and shall be kept in  
22 the original protective PACKAGE or stored by using other  
23 means that afford protection from contamination until  
24 used.

25 (D) *Items that are kept in closed PACKAGES may be stored less  
26 than 15 cm (6 inches) above the floor on dollies, pallets,  
27 racks, and skids that are designed as specified under §  
28 4-204.122*

29 **4-903.12 Prohibitions.**

30 (A) Except as specified in ¶ (B) of this section, cleaned and

1 SANITIZED EQUIPMENT, UTENSILS, laundered LINENS, and SINGLE-  
2 SERVICE and SINGLE-USE ARTICLES shall not be stored:

- 3 (1) In locker rooms;  
4 (2) In toilet rooms;  
5 (3) In garbage rooms;  
6 (4) In mechanical rooms;  
7 (5) Under sewer lines that are not shielded to intercept  
8 potential drips;  
9 (6) Under leaking water lines including leaking  
10 automatic fire sprinkler heads or under lines on  
11 which water has condensed;  
12 (7) Under open stairwells; or  
13 (8) Under other sources of contamination.

14 (B) *Laundered LINENS and SINGLE-SERVICE and SINGLE-USE ARTICLES*  
15 *that are PACKAGED or in a facility such as a cabinet may*  
16 *be stored in a locker room.*

17 **Preventing**

**4-904.11 Kitchenware and Tableware.**

18 **Contamination**

- 19 (A) SINGLE-SERVICE and SINGLE-USE ARTICLES and cleaned and  
20 SANITIZED UTENSILS shall be handled, displayed, and  
21 dispensed so that contamination of FOOD- and lip-contact  
22 surfaces is prevented.  
23 (B) Knives, forks, and spoons that are not prewrapped shall  
24 be presented so that only the handles are touched by  
25 EMPLOYEES and by CONSUMERS if CONSUMER self-service is  
26 provided.  
27 (C) Except as specified under ¶ (B) of this section, SINGLE-  
28 SERVICE ARTICLES that are intended for FOOD- or lip-contact  
29 shall be furnished for CONSUMER self-service with the  
30 original individual wrapper intact or from an APPROVED  
dispenser.

**4-904.12 Soiled and Clean Tableware.**

Soiled TABLEWARE shall be removed from CONSUMER eating and drinking areas and handled so that clean TABLEWARE is not contaminated.

**4-904.13 Preset Tableware.**

(A) TABLEWARE that is preset shall be protected from contamination by being wrapped, covered, or inverted.

(B) When TABLEWARE is preset, exposed, unused settings shall be:

(1) Removed when a CONSUMER is seated; or

(2) Cleaned and SANITIZED before further use if the settings are not removed when a CONSUMER is seated.

**5-101.13 Bottled Drinking Water.\***

BOTTLED DRINKING WATER used or sold in a FOOD ESTABLISHMENT shall be obtained from APPROVED sources in accordance with 21 CFR 129 - Processing and Bottling of Bottled DRINKING WATER.

**Quality**

**5-102.11 Standards.\***

Except as specified under § 5-102.12:

- (A) Water from a PUBLIC WATER SYSTEM shall meet 40 CF141 - National Primary Drinking Water Regulations and state DRINKING WATER quality standards; and
- (B) Water from a nonPUBLIC WATER SYSTEM shall meet state DRINKING WATER quality standards.

**5-102.12 Nondrinking Water.\***

- (A) A nonDRINKING WATER supply shall be used only if its use is APPROVED.
- (B) NonDRINKING WATER shall be used only for nonculinary purposes such as air conditioning, nonFOOD EQUIPMENT cooling, fire protection, and irrigation.

**5-102.13 Sampling.**

Except when used as specified under §5-102.12, water from a nonPUBLIC WATER SYSTEM shall be sampled and tested at least annually and as required by state water quality regulations.

**5-102.14 Sample Report.**

The most recent sample report for the nonpublic WATER SYSTEM shall be retained on file in the FOOD ESTABLISHMENT or the report shall be maintained as specified by state water quality regulations.

**Quantity and Availability**

**5-103.11 Capacity.\***

- (A) The water source and system shall be of sufficient capacity to meet the peak water demands of the FOOD ESTABLISHMENT.
- (B) Hot water generation and distribution systems shall be sufficient to meet the peak hot water demands throughout the

1 FOOD ESTABLISHMENT.

2 **5-103.12 Pressure.**

3 Water under pressure shall be provided to all fixtures, EQUIPMENT,  
4 and non FOOD EQUIPMENT that are required to use water *except that*  
5 *water supplied as specified under ¶¶ 5-104.12(A) and (B) to a*  
6 *TEMPORARY FOOD ESTABLISHMENT or in response to a temporary interruption*  
7 *of a water supply need not be under pressure.*

8 **Distribution, 5-104.11 System.**

9 **Delivery, and** Water shall be received from the source through the use of:

10 **Retention**

- (A) An APPROVED public water main; or
- (B) One or more of the following that shall be constructed,  
12 maintained, and operated according to LAW:
- (1) Nonpublic water main, water pumps, pipes, hoses,  
14 connections, and other appurtenances,
- (2) Water transport vehicles, or
- (3) Water containers.

17 **5-104.12 Alternative Water Supply.**

18 Water meeting the requirements specified under Subparts 5-101,  
19 5-102, and 5-103 shall be made available for a mobile facility, for a  
20 TEMPORARY FOOD ESTABLISHMENT without a permanent water supply, and  
21 for a FOOD ESTABLISHMENT with a temporary interruption of its water  
22 supply through:

- (A) A supply of containers of commercially BOTTLED DRINKING WATER;
- (B) One or more closed portable water containers;
- (C) An enclosed vehicular water tank;
- (D) An on-PREMISES water storage tank; or
- (E) Piping, tubing, or hoses connected to an adjacent APPROVED  
28 source.

29 **5-2 PLUMBING SYSTEM**

5		<b>5-204 Location and Placement</b>
6		<b>5-205 Operation and Maintenance</b>
7		
8	<b>Materials</b>	<b>5-201.11 Approved.*</b>
9		(A) A PLUMBING SYSTEM and hoses conveying water shall be
10		constructed and repaired with APPROVED materials according
11		to LAW.
12		(B) A water filter shall be made of SAFE MATERIALS.
13	<b>Design,</b>	<b>5-202.11 Approved System and Cleanable Fixtures.*</b>
14	<b>Construction,</b>	(A) A PLUMBING SYSTEM shall be designed, constructed, and
15	<b>and Installation</b>	installed according to LAW.
16		(B) A PLUMBING FIXTURE such as a HANDWASHING SINK, toilet, or
17		urinal shall be EASILY CLEANABLE. <sup>N</sup>
18		<b>5-202.12 Handwashing Sink, Installation.</b>
19		(A) A HANDWASHING SINK shall be equipped to provide water at a
20		temperature of at least 38°C (100°F) through a mixing valve
21		or combination faucet.
22		(B) A steam mixing valve shall not be used at a HANDWASHING
23		SINK.
24		(C) A self-closing, slow-closing, or metering faucet shall provide
25		a flow of water for at least 15 seconds without the need to
26		reactivate the faucet.
27		(D) An automatic handwashing facility shall be installed in
28		accordance with manufacturer's instructions.
29		<b>5-202.13 Backflow Prevention, Air Gap.*</b>

1 An air gap between the water supply inlet and the flood level rim  
 2 of the PLUMBING FIXTURE, EQUIPMENT, or nonFOOD EQUIPMENT shall  
 3 be at least twice the diameter of the water supply inlet and shall  
 4 not be less than 25 mm (1 inch).

5 **5-202.14 Backflow Prevention Device, Design Standard.**

6 A backflow or backsiphonage prevention device installed on a  
 7 water supply system shall meet American Society of Sanitary  
 8 Engineering (A.S.S.E.) standards for construction, installation,  
 9 maintenance, inspection, and testing for that specific application  
 10 and type of device.

11 **5-202.15 Conditioning Device, Design.**

12 A water filter, screen, and other water conditioning device installed on  
 13 water lines shall be designed to facilitate disassembly for periodic  
 14 servicing and cleaning. A water filter element shall be of the  
 15 replaceable type.

16 **Numbers and**  
 17 **Capacities**

18 **5-203.11 Handwashing Sinks.\***

19 (A) Except as specified in ¶¶ (B) and (C) of this section, at  
 20 least 1 HANDWASHING SINK, a number of HANDWASHING SINKS  
 21 necessary for their convenient use by EMPLOYEES in areas  
 22 specified under § 5-204.11, and not fewer than the number  
 23 of HANDWASHING SINKS required by LAW shall be provided.

24 (B) *If APPROVED and capable of removing the types of soils*  
 25 *encountered in the FOOD operations involved, automatic*  
 26 *handwashing facilities may be substituted for HANDWASHING SINKS*  
 27 *in a FOOD ESTABLISHMENT that has at least one HANDWASHING SINK.*

28 (C) *If APPROVED, when FOOD exposure is limited and HANDWASHING*  
 29 *SINKS are not conveniently available, such as in some mobile or*  
 30 *TEMPORARY FOOD ESTABLISHMENTS or at some VENDING MACHINE*  
*LOCATIONS, EMPLOYEES may use chemically treated towelettes for*  
*handwashing.*

**5-203.12 Toilets and Urinals.\***

At least 1 toilet and not fewer than the toilets required by LAW shall be provided. If authorized by LAW and urinals are substituted for toilets, the substitution shall be done as specified in LAW.

**5-203.13 Service Sink.**

At least 1 service sink or 1 curbed cleaning facility equipped with a floor drain shall be provided and conveniently located for the cleaning of mops or similar wet floor cleaning tools and for the disposal of mop water and similar liquid waste.

**5-203.14 Backflow Prevention Device, When Required.\***

A PLUMBING SYSTEM shall be installed to preclude backflow of a solid, liquid, or gas contaminant into the water supply system at each point of use at the FOOD ESTABLISHMENT, including on a hose bibb if a hose is attached or on a hose bibb if a hose is not attached and backflow prevention is required by LAW, by:

- (A) Providing an air gap as specified under § 5-202.13; or
- (B) Installing an APPROVED backflow prevention device as Specified under § 5-202.14.

**5-203.15 Backflow Prevention Device, Carbonator.\***

- (A) If not provided with an air gap as specified under § 5-202.13, a double check valve with an intermediate vent preceded by a screen of not less than 100 mesh to 25.4 mm (100 mesh to 1 inch) shall be installed upstream from a carbonating device and downstream from any copper in the water supply line.
- (B) *A single or double check valve attached to the carbonator need not be of the vented type if an air gap or vented backflow prevention device has been otherwise provided as specified under (A) of this section.*

**Location and 5-204.11 Handwashing Sinks.\***

1 **Placement**

A HANDWASHING SINK shall be located:

2 (A) To allow convenient use by EMPLOYEES in FOOD preparation,  
3 FOOD dispensing, and WAREWASHING areas; and

4 (B) In, or immediately adjacent to, toilet rooms.

5 **5-204.12 Backflow Prevention Device, Location.**

6 A backflow prevention device shall be located so that it may be  
7 serviced and maintained.

8 **5-204.13 Conditioning Device, Location.**

9 A water filter, screen, and other water conditioning device  
10 installed on water lines shall be located to facilitate disassembly  
11 for periodic servicing and cleaning.

12 **Operation and 5-205.11 Using a Handwashing Sink.**13 **Maintenance**

(A) A HANDWASHING SINK shall be maintained so that it is  
14 accessible at all times for EMPLOYEE use.

15 (B) A HANDWASHING SINK shall not be used for purposes other  
16 than handwashing.

17 (C) An automatic handwashing facility shall be used in  
18 accordance with manufacturer's instructions.

19 **5-205.12 Prohibiting a Cross Connection.\***

20 (A) A PERSON shall not create a cross connection by  
21 connecting a pipe or conduit between the DRINKING WATER  
22 system and a non DRINKING WATER system or a water  
23 system of unknown quality.

24 (B) The piping of a nonDRINKING WATER system shall be  
25 durably identified so that it is readily distinguishable from  
26 piping that carries DRINKING WATER.<sup>N</sup>

27 **5-205.13 Scheduling Inspection and Service for a Water**  
28 **System Device.**

1 A device such as a water treatment device or backflow preventer  
2 shall be scheduled for inspection and service, in accordance with  
3 manufacturer's instructions and as necessary to prevent device  
4 failure based on local water conditions, and records demonstrating  
5 inspection and service shall be maintained by the PERSON IN  
6 CHARGE.

7 **5-205.14 Water Reservoir of Fogging Devices, Cleaning.\***

8 (A) A reservoir that is used to supply water to a device such  
9 as a produce fogger shall be:

- 10 (1) Maintained in accordance with manufacturer's  
11 specifications; and  
12 (2) Cleaned in accordance with manufacturer's specifications  
13 or according to the procedures specified under ¶(B)  
14 of this section, whichever is more stringent.

15 (B) Cleaning procedures shall include at least the following  
16 steps and shall be conducted at least once a week:

- 17 (1) Draining and complete disassembly of the water and  
18 aerosol contact parts;  
19 (2) Brush-cleaning the reservoir, aerosol tubing, and  
20 discharge nozzles with a suitable detergent solution;  
21 (3) Flushing the complete system with water to remove the  
22 detergent solution and particulate accumulation; and  
23 (4) Rinsing by immersing, spraying, or swabbing the  
24 reservoir, aerosol tubing, and discharge nozzles with  
25 at least 50 MG/L hypochlorite solution.

26 **5-205.15 System Maintained in Good Repair.\***

27 A PLUMBING SYSTEM shall be:

- 28 (A) Repaired according to LAW; and  
29 (B) Maintained in good repair.<sup>5</sup>

30

1 **5-3 MOBILE WATER TANK AND MOBILE FOOD ESTABLISHMENT WATER**  
 2 **TANK**

3 ***Subparts***

- 4 **5-301 Materials**  
 5 **5-302 Design and Construction**  
 6 **5-303 Numbers and Capacities**  
 7 **5-304 Operation and Maintenance**

8  
 9 ***Materials*** **5-301.11 Approved.**

10 Materials that are used in the construction of a mobile water tank,  
 11 mobile FOOD ESTABLISHMENT water tank, and appurtenances shall be:

- 12 (A) Safe;  
 13 (B) Durable, CORROSION-RESISTANT, and nonabsorbent; and  
 14 (C) Finished to have a SMOOTH, EASILY CLEANABLE surface.

15 ***Design and*** **5-302.11 Enclosed System, Sloped to Drain.**

16 ***Construction*** A mobile water tank shall be:

- 17 (A) Enclosed from the filling inlet to the discharge outlet; and  
 18 (B) Sloped to an outlet that allows complete drainage of the  
 19 tank.

20 **5-302.12 Inspection and Cleaning Port, Protected and**  
 21 **Secured.**

22 If a water tank is designed with an access port for inspection and  
 23 cleaning, the opening shall be in the top of the tank and:

- 24 (A) Flanged upward at least 13 mm (one-half inch); and  
 25 (B) Equipped with a port cover assembly that is:  
 26 (1) Provided with a gasket and a device for securing  
 27 the cover in place, and  
 28 (2) Flanged to overlap the opening and sloped to drain.

29 **5-302.13 “V” Type Threads, Use Limitation.**

1 A fitting with "V" type threads on a water tank inlet or outlet shall  
2 be allowed only when a hose is permanently attached.

3 **5-302.14 Tank Vent, Protected.**

4 If provided, a water tank vent shall terminate in a downward  
5 direction and shall be covered with:

- 6 (A) 16 mesh to 25.4 mm (16 mesh to 1 inch) screen or  
7 equivalent when the vent is in a protected area; or  
8 (B) A protective filter when the vent is in an area that is not  
9 protected from windblown dirt and debris.

10 **5-302.15 Inlet and Outlet, Sloped to Drain.**

- 11 (A) A water tank and its inlet and outlet shall be sloped to  
12 drain.  
13 (B) A water tank inlet shall be positioned so that it is protected  
14 from contaminants such as waste discharge, road dust, oil,  
15 or grease.

16 **5-302.16 Hose, Construction and Identification.**

17 A hose used for conveying DRINKING WATER from a water tank shall  
18 be:

- 19 (A) Safe;  
20 (B) Durable, CORROSION-RESISTANT, and nonabsorbent;  
21 (C) Resistant to pitting, chipping, crazing, scratching, scoring,  
22 distortion, and decomposition;  
23 (D) Finished with a SMOOTH interior surface; and  
24 (E) Clearly and durably identified as to its use if not  
25 permanently attached.

26 **Numbers and**  
27 **Capacities**

28 **5-303.11 Filter, Compressed Air.**

29 A filter that does not pass oil or oil vapors shall be installed in  
30 the air supply line between the compressor and DRINKING WATER  
system when compressed air is used to pressurize the water  
tank system.

1                   **5-303.12     Protective Cover or Device.**

2                   A cap and keeper chain, closed cabinet, closed storage tube, or  
3                   other APPROVED protective cover or device shall be provided for a  
4                   water inlet, outlet, and hose.

5                   **5-303.13     Mobile Food Establishment Tank Inlet.**

6                   A mobile FOOD ESTABLISHMENT'S water tank inlet shall be:

- 7                   (A)    19.1 mm (three-fourths inch) in inner diameter or less; and  
8                   (B)    Provided with a hose connection of a size or type that will  
9                   prevent its use for any other service.

10    **Operation and**

11    **Maintenance**

12                   **5-304.11     System Flushing and Sanitization.\***

13                   A water tank, pump, and hoses shall be flushed and SANITIZED  
14                   before being placed in service after construction, repair  
15                   modification, and periods of nonuse.

16                   **5-304.12     Using a Pump and Hoses, Backflow Prevention.**

17                   A PERSON shall operate a water tank, pump, and hoses so that backflow  
18                   and other contamination of the water supply are prevented.

19                   **5-304.13     Protecting Inlet, Outlet, and Hose Fitting.**

20                   If not in use, a water tank and hose inlet and outlet fitting shall  
21                   be protected using a cover or device as specified under § 5-303.12.

22                   **5-304.14     Tank, Pump, and Hoses, Dedication.**

23                   (A)    Except as specified in ¶(B) of this section, a water tank,  
24                   pump, and hoses used for conveying DRINKING WATER shall be  
25                   used for no other purpose.

26                   (B)    *Water tanks, pumps, and hoses APPROVED for liquid FOODS may  
27                   be used for conveying DRINKING WATER if they are cleaned  
28                   and SANITIZED before they are used to convey water.*

29    **5-4    SEWAGE, OTHER LIQUID WASTE, AND RAINWATER**

**Subparts**

1	<b>5-401</b>	<b>Mobile Holding Tank</b>
2	<b>5-402</b>	<b>Retention, Drainage, and Delivery</b>
3	<b>5-403</b>	<b>Disposal Facility</b>
4		
5	<b>Mobile Holding</b>	<b>5-401.11 Capacity and Drainage.</b>
6	<b>Tank</b>	A SEWAGE holding tank in a mobile FOOD ESTABLISHMENT shall be:
7		(A) Sized 15 percent larger in capacity than the water supply
8		tank; and
9		(B) Sloped to a drain that is 25 mm (1 inch) in inner diameter or
10		greater, equipped with a shut-off valve.
11	<b>Retention,</b>	<b>5-402.10 Establishment Drainage System.</b>
12	<b>Drainage, and</b>	FOOD ESTABLISHMENT drainage systems, including grease traps,
13	<b>Delivery</b>	that convey SEWAGE shall be designed and installed as specified
14	<i>design,</i>	under ¶ 5-202.11(A).
15	<i>construction, and</i>	
16	<i>installation</i>	
17		<b>5-402.11 Backflow Prevention.*</b>
18		(A) Except as specified in ¶¶ (B), (C), and (D) of this section, a
19		direct connection shall not exist between the SEWAGE system and a
20		drain originating from EQUIPMENT in which FOOD, portable EQUIPMENT,
21		or UTENSILS are placed.
22		(B) <i>Paragraph (A) of this section does not apply to floor drains</i>
23		<i>that originate in refrigerated spaces that are constructed as</i>
24		<i>an integral part of the building.</i>
25		(C) <i>If allowed by LAW, a WAREWASHING machine may have a</i>
26		<i>direct connection between its waste outlet and a floor drain</i>
27		<i>when the machine is located within 1.5 m (5 feet) of a</i>
28		<i>trapped floor drain and the machine outlet is connected to</i>
29		<i>the inlet side of a properly vented floor drain trap.</i>

(D) *If allowed by LAW, a WAREWASHING or culinary sink may have a direct connection.*

*location and placement*

**5-402.12 Grease Trap.**

If used, a grease trap shall be located to be easily accessible for cleaning.

*operation and maintenance*

**5-402.13 Conveying Sewage.\***

SEWAGE shall be conveyed to the point of disposal through an APPROVED sanitary SEWAGE system or other system, including use of SEWAGE transport vehicles, waste retention tanks, pumps, pipes, hoses, and connections that are constructed, maintained, and operated according to LAW.

**5-402.14 Removing Mobile Food Establishment Wastes.**

SEWAGE and other liquid wastes shall be removed from a mobile FOOD ESTABLISHMENT at an APPROVED waste SERVICING AREA or by a SEWAGE transport vehicle in such a way that a public health HAZARD or nuisance is not created.

**5-402.15 Flushing a Waste Retention Tank.**

A tank for liquid waste retention shall be thoroughly flushed and drained in a sanitary manner during the servicing operation.

***Disposal Facility***

**5-403.11 Approved Sewage Disposal System.\***

*design and construction*

SEWAGE shall be disposed through an APPROVED facility that is:

- (A) A public SEWAGE treatment plant; or
- (B) An individual SEWAGE disposal system that is sized, constructed, maintained, and operated according to LAW.

**5-403.12 Other Liquid Wastes and Rainwater.**

Condensate drainage and other nonSEWAGE liquids and rainwater shall be drained from point of discharge to disposal according to LAW.

**5-5**

**REFUSE, RECYCLABLES, AND RETURNABLES**

1                   **Subparts**

2                   **5-501           Facilities on the Premises**

3                   **5-502           Removal**

4                   **5-503           Facilities for Disposal and Recycling**

5   **Facilities on the** **5-501.10   Indoor Storage Area.**

6   **Premises**       If located within the FOOD ESTABLISHMENT, a storage area for  
7   *materials, design,* REFUSE, recyclables, and returnables shall meet the requirements  
8   *construction, and* specified under §§ 6-101.11, 6-201.11–6-201.18, 6-202.15, and  
9   *installation*     6-202.16

10                  **5-501.11    Outdoor Storage Surface.**

11                  An outdoor storage surface for REFUSE, recyclables, and returnables  
12                  shall be constructed of nonabsorbent material such as concrete  
13                  or asphalt and shall be SMOOTH, durable, and sloped to drain.

14                  **5-501.12    Outdoor Enclosure.**

15                  If used, an outdoor enclosure for REFUSE, recyclables, and returnables  
16                  shall be constructed of durable and cleanable materials.

17                  **5-501.13    Receptacles.**

18                  (A)   Except as specified in ¶ (B) of this section, receptacles  
19                  and waste handling units for REFUSE, recyclables, and  
20                  returnables and for use with materials containing FOOD  
21                  residue shall be durable, cleanable, insect-and rodent-  
22                  resistant, leakproof, and non absorbent.

23                  (B)   *Plastic bags and wet strength paper bags may be used to*  
24                  *line receptacles for storage inside the FOOD ESTABLISHMENT,*  
25                  *or within closed outside receptacles.*

26                  **5-501.14    Receptacles in Vending Machines.**

27                  *Except for a receptacle for BEVERAGE bottle crown closures, a*  
28                  REFUSE receptacle shall not be located within a VENDING MACHINE.

29                  **5-501.15    Outside Receptacles.**

30                  (A)   Receptacles and waste handling units for REFUSE,

1           recyclables, and returnables used with materials containing  
2           FOOD residue and used outside the FOOD ESTABLISHMENT  
3           shall be designed and constructed to have tight-fitting lids,  
4           doors, or covers.

- 5           (B) Receptacles and waste handling units for REFUSE and recyclables  
6           such as an on-site compactor shall be installed so that  
7           accumulation of debris and insect and rodent attraction and  
8           harborage are minimized and effective cleaning is facilitated  
9           around and, if the unit is not installed flush with the base  
10          pad, under the unit.

11   *numbers and*  
12   *capacities*

**5-501.16     Storage Areas, Rooms, and Receptacles Capacity,  
                  and Availability.**

- 13          (A) An inside storage room and area and outside storage area  
14          and enclosure, and receptacles shall be of sufficient  
15          capacity to hold REFUSE, recyclables, and returnables that  
16          accumulate.
- 17          (B) A receptacle shall be provided in each area of the FOOD  
18          ESTABLISHMENT OR PREMISES where REFUSE is generated or  
19          commonly discarded, or where recyclables or returnables  
20          are placed.
- 21          (C) If disposable towels are used at handwashing lavatories,  
22          a waste receptacle shall be located at each lavatory or  
23          group of adjacent lavatories.

**5-501.17     Toilet Room Receptacle, Covered.**

24          A toilet room used by females shall be provided with a covered  
25          receptacle for sanitary napkins.

**5-501.18     Cleaning Implements and Supplies.**

- 26          (A) Except as specified in ¶ (B) of this section, suitable  
27          cleaning implements and supplies such as high pressure  
28          pumps, hot water, steam, and detergent shall be provided  
29          30

as necessary for effective cleaning of receptacles and waste handling units for REFUSE, recyclables, and returnables.

(B) *If APPROVED, off-PREMISES-based cleaning services may be used if on-PREMISES cleaning implements and supplies are not provided.*

*location and placement*

**5-501.19 Storage Areas, Redeeming Machines, Receptacles and Waste Handling Units, Location.**

(A) An area designated for REFUSE, recyclables, returnables, and, except as specified in ¶(B) of this section, a redeeming machine for recyclables or returnables shall be located so that it is separate from FOOD, EQUIPMENT, UTENSILS, LINENS, and SINGLE-SERVICE and SINGLE-USE ARTICLES and a public health HAZARD or nuisance is not created.

(B) *A redeeming machine may be located in the PACKAGED FOOD storage area or CONSUMER area of a FOOD ESTABLISHMENT if FOOD, EQUIPMENT, UTENSILS, LINENS, and SINGLE-SERVICE and SINGLE-USE ARTICLES are not subject to contamination from the machines and a public health HAZARD or nuisance is not created.*

(C) The location of receptacles and waste handling units for REFUSE, recyclables, and returnables shall not create a public health HAZARD or nuisance or interfere with the cleaning of adjacent space.

*operation and maintenance*

**5-501.110 Storing Refuse, Recyclables, and Returnables.**

REFUSE, recyclables, and returnables shall be stored in receptacles or waste handling units so that they are inaccessible to insects and rodents.

**5-501.111 Areas, Enclosures, and Receptacles, Good Repair.**

Storage areas, enclosures, and receptacles for REFUSE, recyclables,

1 and returnables shall be maintained in good repair.

2 **5-501.112 Outside Storage Prohibitions.**

3 (A) Except as specified in (B) of this section, REFUSE  
4 receptacles not meeting the requirements specified under  
5 ¶5-501.13(A) such as receptacles that are not rodent-resistant,  
6 unprotected plastic bags and paper bags, or baled units that  
7 contain materials with FOOD residue may not be stored outside.

8 (B) *Cardboard or other packaging material that does not contain*  
9 *FOOD residues and that is awaiting regularly scheduled*  
10 *delivery to a recycling or disposal site may be stored outside*  
11 *without being in a covered receptacle if it is stored so that*  
12 *it does not create a rodent harborage problem.*

13 **5-501.113 Covering Receptacles.**

14 Receptacles and waste handling units for REFUSE, recyclables, and  
15 returnables shall be kept covered:

16 (A) Inside the FOOD ESTABLISHMENT if the receptacles and units:

17 (1) Contain FOOD residue and are not in continuous use;

18 (2) After they are filled; and

19 (B) With tight-fitting lids or doors if kept outside the FOOD  
20 ESTABLISHMENT.

21 **5-501.114 Using Drain Plugs.**

22 Drains in receptacles and waste handling units for REFUSE,  
23 recyclables, and returnables shall have drain plugs in place.

24 **5-501.115 Maintaining Refuse Areas and Enclosures.**

25 A storage area and enclosure for REFUSE, recyclables, or returnables  
26 shall be maintained free of unnecessary items, as specified under  
27 6-501.114, and clean.

28 **5-501.116 Cleaning Receptacles.**

29 (A) Receptacles and waste handling units for REFUSE, recyclables,  
30 and returnables shall be thoroughly cleaned in a way that

1 does not contaminate FOOD, EQUIPMENT, UTENSILS, LINENS, OR  
 2 SINGLE-SERVICE and SINGLE-USE ARTICLES, and waste water shall  
 3 be disposed of as specified under § 5-402.13.

4 (B) Soiled receptacles and waste handling units for REFUSE,  
 5 recyclables, and returnables shall be cleaned at a frequency  
 6 necessary to prevent them from developing a buildup of soil  
 7 or becoming attractants for insects and rodents.

8 ***Removal***

**5-502.11 Frequency.**

9 REFUSE, recyclables, and returnables shall be removed from the  
 10 PREMISES at a frequency that will minimize the development of  
 11 objectionable odors and other conditions that attract or harbor  
 12 insects and rodents.

13 **5-502.12 Receptacles or Vehicles.**

14 REFUSE, recyclables, and returnables shall be removed from the  
 15 PREMISES by way of:

- 16 (A) Portable receptacles that are constructed and maintained  
 17 according to LAW; or  
 18 (B) A transport vehicle that is constructed, maintained, and  
 19 operated according to LAW.

20 ***Facilities for***

**5-503.11 Community or Individual Facility.**

21 ***Disposal and***  
 22 ***Recycling***

23 Solid waste not disposed of through the SEWAGE system such as  
 24 through grinders and pulpers shall be recycled or disposed of in  
 25 an APPROVED public or private community recycling or REFUSE  
 26 facility; or solid waste shall be disposed of in an individual REFUSE  
 facility such as a landfill or incinerator which is sized,  
 constructed, maintained, and operated according to LAW.

15 ***Indoor Areas* 6-101.11 Surface Characteristics.**16 (A) Except as specified in ¶ (B) of this section, materials for  
17 indoor floor, wall, and ceiling surfaces under conditions of  
18 normal use shall be:19 (1) SMOOTH, durable, and EASILY CLEANABLE for areas  
20 where FOOD ESTABLISHMENT operations are conducted;21 (2) Closely woven and EASILY CLEANABLE carpet for  
22 carpeted areas; and23 (3) Non absorbent for areas subject to moisture such  
24 as FOOD preparation areas, walk-in refrigerators,  
25 WAREWASHING areas, toilet rooms, mobile FOOD  
26 ESTABLISHMENT SERVICING AREAS, and areas subject to  
27 flushing or spray cleaning methods.28 (B) *In a TEMPORARY FOOD ESTABLISHMENT:*29 (1) *If graded to drain, a floor may be concrete,*

*machine-laid asphalt, or dirt or gravel if it is covered with mats, removable platforms, duckboards, or other APPROVED materials that are effectively treated to control dust and mud; and*

(2) *Walls and ceilings may be constructed of a material that protects the interior from the weather and windblown dust and debris.*

**Outdoor Areas 6-102.11 Surface Characteristics.**

(A) The outdoor walking and driving areas shall be surfaced with concrete, asphalt, or gravel or other materials that have been effectively treated to minimize dust, facilitate maintenance, and prevent muddy conditions.

(B) Exterior surfaces of buildings and mobile FOOD ESTABLISHMENTS shall be of weather-resistant materials and shall comply with LAW.

(C) Outdoor storage areas for REFUSE, recyclables, or returnables shall be of materials specified under §§ 5-501.11 and 5-501.12.

**6-202 Functionality**

**Cleanability 6-201.11 Floors, Walls, and Ceilings.**

Except as specified under § 6-201.14 and *except for antislip floor coverings or applications that may be used for safety reasons*, floors, floor coverings, walls, wall coverings, and ceilings shall be designed, constructed, and installed so they are SMOOTH and EASILY CLEANABLE.

**6-201.12 Floors, Walls, and Ceilings, Utility Lines.**

- 1 (A) Utility service lines and pipes may not be unnecessarily  
2 exposed
- 3 (B) Exposed utility service lines and pipes shall be installed  
4 so they do not obstruct or prevent cleaning of the floors,  
5 walls, or ceilings.
- 6 (C) Exposed horizontal utility service lines and pipes may not  
7 be installed on the floor.

8 **6-201.13 Floor and Wall Junctures, Coved, and Enclosed**  
9 **or Sealed.**

- 10 (A) In FOOD ESTABLISHMENTS in which cleaning methods other than  
11 water flushing are used for cleaning floors, the floor and  
12 wall junctures shall be coved and closed to no larger  
13 than 1 mm (one thirty-second inch).
- 14 (B) The floors in FOOD ESTABLISHMENTS in which water flush  
15 cleaning methods are used shall be provided with drains  
16 and be graded to drain, and the floor and wall junctures  
17 shall be coved and SEALED.

18 **6-201.14 Floor Carpeting, Restrictions and Installation.**

- 19 (A) A floor covering such as carpeting or similar material  
20 may not be installed as a floor covering in FOOD  
21 preparation areas, walk-in refrigerators, WAREWASHING  
22 areas, toilet room areas where handwashing lavatories,  
23 toilets, and urinals are located, REFUSE storage rooms, or  
24 other areas where the floor is subject to moisture,  
25 flushing, or spray cleaning methods.
- 26 (B) If carpeting is installed as a floor covering in areas other  
27 than those specified under ¶ (A) of this section, it shall  
28 be:
- 29 (1) Securely attached to the floor with a durable  
30 mastic, by using a stretch and tack method, or by

1 another method; and

- 2 (2) Installed tightly against the wall under the coving or  
3 installed away from the wall with a space between  
4 the carpet and the wall and with the edges of the  
5 carpet secured by metal stripping or some other  
6 means.

7 **6-201.15 Floor Covering, Mats and Duckboards.**

8 Mats and duckboards shall be designed to be removable and  
9 EASILY CLEANABLE.

10 **6-201.16 Wall and Ceiling Coverings and Coatings.**

11 (A) Wall and ceiling covering materials shall be attached so  
12 that they are EASILY CLEANABLE.

13 (B) *Except in areas used only for dry storage*, concrete,  
14 porous blocks, or bricks used for indoor wall construction  
15 shall be finished and SEALED to provide a SMOOTH,  
16 nonabsorbent, EASILY CLEANABLE surface.

17 **6-201.17 Walls and Ceilings, Attachments.**

18 (A) Except as specified in ¶ (B) of this section, attachments  
19 to walls and ceilings such as light fixtures, mechanical  
20 room ventilation system components, vent covers, wall  
21 mounted fans, decorative items, and other attachments  
22 shall be EASILY CLEANABLE.

23 (B) *In a CONSUMER area, wall and ceiling surfaces and*  
24 *decorative items and attachments that are provided for*  
25 *ambiance need not meet this requirement if they are kept*  
26 *clean.*

27 **6-201.18 Walls and Ceilings, Studs, Joists, and Rafters.**

28 *Except for TEMPORARY FOOD ESTABLISHMENTS*, studs, joists, and  
29 rafters may not be exposed in areas subject to moisture.

30 **Functionality**

**6-202.11 Light Bulbs, Protective Shielding.**

- 1 (A) Except as specified in ¶ (B) of this section, light bulbs  
2 shall be shielded, coated, or otherwise shatter-resistant in  
3 areas where there is exposed FOOD; clean EQUIPMENT,  
4 UTENSILS, and LINENS; or unwrapped SINGLE-SERVICE and  
5 SINGLE-USE ARTICLES.
- 6 (B) *Shielded, coated, or otherwise shatter-resistant bulbs need*  
7 *not be used in areas used only for storing FOOD in*  
8 *unopened packages, if:*
- 9 (1) *The integrity of the packages cannot be affected*  
10 *by broken glass falling onto them; and*
- 11 (2) *The packages are capable of being cleaned of*  
12 *debris from broken bulbs before the packages are*  
13 *opened.*
- 14 (C) An infrared or other heat lamp shall be protected  
15 against breakage by a shield surrounding and extending  
16 beyond the bulb so that only the face of the bulb is  
17 exposed.

18 **6-202.12 Heating, Ventilating, Air Conditioning System**  
19 **Vents.**

20 Heating, ventilating, and air conditioning systems shall be  
21 designed and installed so that make-up air intake and exhaust  
22 vents do not cause contamination of FOOD, FOOD-CONTACT SURFACES,  
23 EQUIPMENT, OR UTENSILS.

24 **6-202.13 Insect Control Devices, Design and Installation.**

- 25 (A) Insect control devices that are used to electrocute or stun  
26 flying insects shall be designed to retain the insect within  
27 the device.
- 28 (B) Insect control devices shall be installed so that:
- 29 (1) The devices are not located over a FOOD  
30 preparation area; and

- 1 (2) Dead insects and insect fragments are prevented  
2 from being impelled onto or falling on exposed  
3 FOOD; clean EQUIPMENT, UTENSILS, and LINENS; and  
4 unwrapped SINGLE-SERVICE and SINGLE-USE ARTICLES.

5 **6-202.14 Toilet Rooms, Enclosed.**

6 *Except where a toilet room is located outside a FOOD ESTABLISHMENT*  
7 *and does not open directly into the FOOD ESTABLISHMENT such as a*  
8 *toilet room that is provided by the management of a shopping mall, a*  
9 *toilet room located on the PREMISES shall be completely enclosed*  
10 *and provided with a tight-fitting and self-closing door.*

11 **6-202.15 Outer Openings, Protected.**

12 (A) Except as specified in ¶¶ (B), (C), and (E) and under ¶  
13 (D) of this section, outer openings of a FOOD  
14 ESTABLISHMENT shall be protected against the entry of  
15 insects and rodents by:

- 16 (1) Filling or closing holes and other gaps along  
17 floors, walls, and ceilings;  
18 (2) Closed, tight-fitting windows; and  
19 (3) Solid, self-closing, tight-fitting doors.

20 (B) *Paragraph (A) of this section does not apply if a FOOD*  
21 *ESTABLISHMENT opens into a larger structure, such as a*  
22 *mall, airport, or office building, or into an attached*  
23 *structure, such as a porch, and the outer openings from*  
24 *the larger or attached structure are protected against the*  
25 *entry of insects and rodents.*

26 (C) *Exterior doors used as exits need not be self-closing if*  
27 *they are:*

- 28 (1) *Solid and tight-fitting;*  
29 (2) *Designated for use only when an emergency exists,*  
30 *by the fire protection authority that has jurisdiction*

1 *over the FOOD ESTABLISHMENT; and*

2 (3) *Limited-use so they are not used for entrance or*  
3 *exit from the building for purposes other than the*  
4 *designated emergency exit use.*

5 (D) Except as specified in ¶¶ (B) and (E) of this section, if the  
6 windows or doors of a FOOD ESTABLISHMENT, or of a  
7 larger structure within which a FOOD ESTABLISHMENT is  
8 located, are kept open for ventilation or other purposes  
9 or a TEMPORARY FOOD ESTABLISHMENT is not provided with  
10 windows and doors as specified under ¶ (A) of this  
11 section, the openings shall be protected against the  
12 entry of insects and rodents by:

13 (1) 16 mesh to 25.4 mm (16 mesh to 1 inch) screens;

14 (2) Properly designed and installed air curtains to  
15 control flying insects; or

16 (3) Other effective means.

17 (E) *Paragraph (D) of this section does not apply if flying insects*  
18 *and other pests are absent due to the location of the*  
19 *ESTABLISHMENT, the weather, or other limiting condition.*

20 **6-202.16 Exterior Walls and Roofs, Protective Barrier.**

21 Perimeter walls and roofs of a FOOD ESTABLISHMENT shall effectively  
22 protect the establishment from the weather and the entry of  
23 insects, rodents, and other animals.

24 **6-202.17 Outdoor Food Vending Areas, Overhead Protection.**

25 *Except for machines that vend canned BEVERAGES, if located*  
26 *outside, a machine used to vend FOOD shall be provided with*  
27 *overhead protection.*

28 **6-202.18 Outdoor Servicing Areas, Overhead Protection.**

29 *Except for areas used only for the loading of water or the*  
30 *discharge of SEWAGE and other liquid waste, through the use of*

1            *a closed system of hoses, SERVICING AREAS shall be provided*  
2            with overhead protection.

3            **6-202.19    Outdoor Walking and Driving Surfaces, Graded**  
4            **to Drain.**

5            Exterior walking and driving surfaces shall be graded to drain.

6            **6-202.110   Outdoor Refuse Areas, Curbed and Graded to**  
7            **Drain.**

8            Outdoor REFUSE areas shall be constructed in accordance  
9            with LAW and shall be curbed and graded to drain to collect  
10           and dispose of liquid waste that results from the REFUSE and  
11           from cleaning the area and waste receptacles.

12           **6-202.111   Private Homes and Living or Sleeping Quarters,**  
13           **Use Prohibition.**

14           A private home, a room used as living or sleeping quarters, or  
15           an area directly opening into a room used as living or sleeping  
16           quarters shall not be used for conducting FOOD ESTABLISHMENT  
17           operations.

18           **6-202.112   Living or Sleeping Quarters, Separation.**

19           Living or sleeping quarters located on the PREMISES of a FOOD  
20           ESTABLISHMENT such as those provided for lodging registration  
21           clerks or resident managers shall be separated from rooms and  
22           areas used for FOOD ESTABLISHMENT operations by complete  
23           partitioning and solid self-closing doors.

24

1 **6-3 NUMBERS AND CAPACITIES**

2 ***Subparts***

- 3 **6-301 Handwashing Sinks**  
 4 **6-302 Toilets and Urinals**  
 5 **6-303 Lighting**  
 6 **6-304 Ventilation**  
 7 **6-305 Dressing Areas and Lockers**  
 8 **6-306 Service Sinks**

9  
 10 ***Handwashing*** **6-301.10 Minimum Number.**

11 ***Sinks*** HANDWASHING SINKS shall be provided as specified under  
 12 § 5-203.11.

13 **6-301.11 Handwashing Cleanser, Availability.**

14 Each HANDWASHING SINK or group of 2 adjacent HANDWASHING  
 15 SINKS shall be provided with a supply of hand cleaning liquid  
 16 or powder soap.

17 **6-301.12 Hand Drying Provision.**

18 Each HANDWASHING SINK or group of adjacent HANDWASHING SINKS  
 19 shall be provided with:

- 20 (A) Individual, disposable towels;  
 21 (B) A continuous towel system that supplies the user with a  
 22 clean towel; or  
 23 (C) A heated-air hand drying device.

24 **6-301.13 Handwashing Aids and Devices, Use Restrictions.**

25 A sink used for FOOD preparation or UTENSIL washing, or a  
 26 service sink or curbed cleaning facility used for the disposal of  
 27 mop water or similar wastes, shall not be provided with the  
 28 handwashing aids and devices required for a HANDWASHING SINK  
 29 as specified under §§ 6-301.11 and 6-301.12 and ¶ 5-501.16(C).

30 **6-301.14 Handwashing Signage.**

1 A sign or poster that notifies FOOD EMPLOYEES to wash their  
2 hands shall be provided at all HANDWASHING SINKS used by FOOD  
3 EMPLOYEES and shall be clearly visible to FOOD EMPLOYEES.

4 **6-301.20 Disposable Towels, Waste Receptacle.**

5 A HANDWASHING SINK or group of adjacent HANDWASHING SINKS  
6 that is provided with disposable towels shall be provided with a  
7 waste receptacle as specified under ¶ 5-501.16(C).

8 **Toilets and**  
9 **Urinals**

8 **6-302.10 Minimum Number.**

9 Toilets and urinals shall be provided as specified under  
10 § 5-203.12

11 **6-302.11 Toilet Tissue, Availability.**

12 A supply of toilet tissue shall be available at each toilet and  
13 shall be provided to the user in a manner that minimizes its  
14 contamination from dust, water, and other types of  
15 contamination.

16 **Lighting**

16 **6-303.11 Intensity.**

17 The light intensity shall be:

- 18 (A) At least 108 lux (10 foot candles) at a distance of 75 cm  
19 (30 inches) above the floor, in walk-in refrigeration units  
20 and dry FOOD storage areas and in other areas and  
21 rooms during periods of cleaning;
- 22 (B) At least 215 lux (20 foot candles):
- 23 (1) At a surface where FOOD is provided for CONSUMER  
24 self-service such as buffets and salad bars or  
25 where fresh produce or PACKAGED FOODS are sold  
26 or offered for consumption,
- 27 (2) Inside EQUIPMENT such as reach-in and under-  
28 counter refrigerators; and
- 29 (3) At a distance of 75 cm (30 inches) above the floor  
30 in areas used for handwashing, WAREWASHING, and

1 EQUIPMENT and UTENSIL storage, and in toilet rooms;  
2 and

3 (C) At least 540 lux (50 foot candles) at a surface where a  
4 FOOD EMPLOYEE is working with FOOD or working with  
5 UTENSILS OR EQUIPMENT such as knives, slicers, grinders,  
6 or saws where EMPLOYEE safety is a factor.

7 **Ventilation**      **6-304.11 Mechanical.**

8 If necessary to keep rooms free of excessive heat, steam,  
9 condensation, vapors, obnoxious odors, smoke, and fumes,  
10 mechanical ventilation of sufficient capacity shall be provided.

11 **Dressing Areas**      **6-305.11 Designation.**

12 **and** (A) Dressing rooms or dressing areas shall be designated  
13 **Lockers** if EMPLOYEES routinely change their clothes in the  
14 establishment.

15 (B) Lockers or other suitable facilities shall be provided for  
16 the orderly storage of EMPLOYEES' clothing and other  
17 possessions.

18 **Service Sinks**      **6-306.10 Availability.**

19 A service sink or curbed cleaning facility shall be provided as  
20 specified under § 5-203.13.

21

22 **6-4 LOCATION AND PLACEMENT**

23 **Subparts**

24                      **6-401 Handwashing Sinks**

25                      **6-402 Toilet Rooms**

26                      **6-403 Employee Accommodations**

27                      **6-404 Distressed Merchandise**

28                      **6-405 Refuse, Recyclables, and Returnables**

29

30 **Handwashing**      **6-401.10 Conveniently Located.**

- 1    **Sinks**                   HANDWASHING SINKS shall be conveniently located as specified  
2                                   under § 5-204.11.
- 3    **Toilet Rooms**       **6-402.11    Convenience and Accessibility.**  
4                                   Toilet rooms shall be conveniently located and accessible to  
5                                   EMPLOYEES during all hours of operation.
- 6    **Employee**           **6-403.11    Designated Areas.**
- 7    **Accommodations** (A)   Areas designated for EMPLOYEES to eat, drink, and use  
8                                   tobacco shall be located so that FOOD, EQUIPMENT, LINENS, and  
9                                   SINGLE-SERVICE and SINGLE-USE ARTICLES are protected from  
10                                  contamination.
- 11                               (B)   Lockers or other suitable facilities shall be located in a  
12                                  designated room or area where contamination of FOOD,  
13                                  EQUIPMENT, UTENSILS, LINENS, and SINGLE-SERVICE and SINGLE-  
14                                  USE ARTICLES cannot occur.
- 15   **Distressed**       **6-404.11    Segregation and Location.**
- 16   **Merchandise**       Products that are held by the PERMIT HOLDER for credit,  
17                                  redemption, or return to the distributor, such as damaged,  
18                                  spoiled, or recalled products, shall be segregated and held in  
19                                  designated areas that are separated from FOOD, EQUIPMENT,  
20                                  UTENSILS, LINENS, and SINGLE-SERVICE and SINGLE-USE ARTICLES.
- 21   **Refuse,**           **6-405.10    Receptacles, Waste Handling Units, and**  
22   **Recyclables,**                                   **Designated Storage Areas.**  
23   **and**                   Units, receptacles, and areas designated for storage of  
24   **Returnables**       REFUSE and recyclable and returnable containers shall be  
25                                  located under as specified § 5-501.19.

27   **6-5            MAINTENANCE AND OPERATION**

28                   **Subpart**

29                   **6-501 Premises, Structures, Attachments, and Fixtures– Methods**

30   **Premises,**       **6-501.11    Repairing.**

1 **Structures,**  
2 **Attachments,**  
3 **and Fixtures**  
4 **- Methods**

PHYSICAL FACILITIES shall be maintained in good repair.

5 **6-501.12 Cleaning, Frequency and Restrictions.**

6 (A) PHYSICAL FACILITIES shall be cleaned as often as  
7 necessary to keep them clean.

8 (B) *Except for cleaning that is necessary due to a spill or*  
9 *other accident,* cleaning shall be done during periods  
10 when the least amount of FOOD is exposed such as  
11 after closing.

12 **6-501.13 Cleaning Floors, Dustless Methods.**

13 (A) Except as specified in ¶ (B) of this section, only  
14 dustless methods of cleaning shall be used, such as wet  
15 cleaning, vacuum cleaning, mopping with treated dust  
16 mops, or sweeping using a broom and dust-arresting  
17 compounds.

18 (B) *Spills or drippage on floors that occur between normal*  
19 *floor cleaning times may be cleaned:*

20 (1) *Without the use of dust-arresting compounds; and*

21 (2) *In the case of liquid spills or drippage, with the use*  
22 *of a small amount of absorbent compound such as*  
23 *sawdust or diatomaceous earth applied immediately*  
24 *before spot cleaning.*

25 **6-501.14 Cleaning Ventilation Systems, Nuisance and**  
26 **Discharge Prohibition.**

27 (A) Intake and exhaust air ducts shall be cleaned and filters  
28 changed so they are not a source of contamination by  
29 dust, dirt, and other materials.

30 (B) If vented to the outside, ventilation systems shall not

1 create a public health HAZARD or nuisance or unLAWful  
2 discharge.

3 **6-501.15 Cleaning Maintenance Tools, Preventing**  
4 **Contamination.\***

5 FOOD preparation sinks, HANDWASHING SINKS, and WAREWASHING  
6 EQUIPMENT shall not be used for the cleaning of maintenance  
7 tools, the preparation or holding of maintenance materials, or  
8 the disposal of mop water and similar liquid wastes.

9 **6-501.16 Drying Mops.**

10 After use, mops shall be placed in a position that allows them  
11 to air-dry without soiling walls, EQUIPMENT, or supplies.

12 **6-501.17 Absorbent Materials on Floors, Use Limitation.**

13 Except as specified in ¶ 6-501.13(B), sawdust, wood shavings,  
14 granular salt, baked clay, diatomaceous earth, or similar  
15 materials shall not be used on floors.

16 **6-501.18 Cleaning of Plumbing Fixtures.**

17 PLUMBING FIXTURES such as HANDWASHING SINKS, toilets, and urinals  
18 shall be cleaned as often as necessary to keep them clean and  
19 maintained and used as specified under § 5-205.11.

20 **6-501.19 Closing Toilet Room Doors.**

21 *Except during cleaning and maintenance operations,* toilet room  
22 doors as specified under § 6-202.14 shall be kept closed.

23 **6-501.110 Using Dressing Rooms and Lockers.**

24 (A) Dressing rooms shall be used by EMPLOYEES if the  
25 EMPLOYEES regularly change their clothes in the  
26 establishment.

27 (B) Lockers or other suitable facilities shall be used for the  
28 orderly storage of EMPLOYEE clothing and other  
29 possessions.

30 **6-501.111 Controlling Pests.\***

1 The presence of insects, rodents, and other pests shall be  
2 controlled to minimize their presence on the PREMISES by:

- 3 (A) Routinely inspecting incoming shipments of FOOD and  
4 supplies;<sup>N</sup>  
5 (B) Routinely inspecting the PREMISES for evidence of pests;<sup>N</sup>  
6 (C) Using methods, if pests are found, such as trapping  
7 devices or other means of pest control as specified  
8 under §§ 7-202.12, 7-206.12, and 7-206.13; and  
9 (D) Eliminating harborage conditions.<sup>N</sup>

10 **6-501.112 Removing Dead or Trapped Birds, Insects,**  
11 **Rodents, and Other Pests.**

12 Dead or trapped birds, insects, rodents, and other pests shall  
13 be removed from control devices and the PREMISES at a  
14 frequency that prevents their accumulation, decomposition, or  
15 the attraction of pests.

16 **6-501.113 Storing Maintenance Tools.**

17 Maintenance tools such as brooms, mops, vacuum cleaners,  
18 and similar items shall be:

- 19 (A) Stored so they do not contaminate FOOD, EQUIPMENT, UTENSILS,  
20 LINENS, and SINGLE-SERVICE and SINGLE-USE ARTICLES; and  
21 (B) Stored in an orderly manner that facilitates cleaning the  
22 area used for storing the maintenance tools.

23 **6-501.114.1.1 Maintaining Premises, Unnecessary Items**  
24 **and Litter.**

25 The PREMISES shall be free of:

- 26 (A) Items that are unnecessary to the operation or  
27 maintenance of the establishment such as EQUIPMENT  
28 that is nonfunctional or no longer used; and  
29 (B) Litter.

30 **6-501.115 Prohibiting Animals.\***

- 1 (A) Except as specified in ¶¶ (B) and (C) of this section, live  
2 animals shall not be allowed on the PREMISES of a FOOD  
3 ESTABLISHMENT.
- 4 (B) *Live animals may be allowed in the following situations if*  
5 *the contamination of FOOD; clean EQUIPMENT, UTENSILS, and*  
6 *LINENS; and unwrapped SINGLE-SERVICE and SINGLE-USE*  
7 *ARTICLES cannot result.*
- 8 (1) *Edible FISH or decorative FISH in aquariums,*  
9 *shellfish or crustacea on ice or under refrigeration,*  
10 *and shellfish and crustacea in display tank*  
11 *systems;*
- 12 (2) *Patrol dogs accompanying police or security*  
13 *officers in offices and dining, sales, and storage*  
14 *areas, and sentry dogs running loose in outside*  
15 *fenced areas;*
- 16 (3) *In areas that are not used for FOOD preparation*  
17 *and that are usually open for customers, such as*  
18 *dining and sales areas, SERVICE ANIMALS that are*  
19 *controlled by the disabled EMPLOYEE or PERSON, if a*  
20 *health or safety HAZARD will not result from the*  
21 *presence or activities of the SERVICE ANIMAL;*
- 22 (4) *Pets in the common dining areas of institutional*  
23 *care facilities such as nursing homes, assisted*  
24 *living facilities, group homes, or residential care*  
25 *facilities at times other than during meals if:*
- 26 (a) *Effective partitioning and self-closing doors*  
27 *separate the common dining areas from*  
28 *FOOD storage or FOOD preparation areas,*
- 29 (b) *Condiments, EQUIPMENT, and UTENSILS are*  
30 *stored in enclosed cabinets or removed from*

- 1                    *the common dining areas when pets are*  
2                    *present, and*
- 3                    (c) *Dining areas including tables, countertops,*  
4                    *and similar surfaces are effectively cleaned*  
5                    *before the next meal service; and*
- 6                    (5) *In areas that are not used for FOOD preparation,*  
7                    *storage, sales, display, or dining, in which there*  
8                    *are caged animals or animals that are similarly*  
9                    *confined, such as in a variety store that sells pets*  
10                   *or a tourist park that displays animals.*
- 11                   (C) *Live or dead FISH bait may be stored if contamination of*  
12                   *FOOD; clean EQUIPMENT, UTENSILS, and LINENS; and unwrapped*  
13                   *SINGLE-SERVICE and SINGLE-USE ARTICLES cannot result.*

4  
 5   **Storage            7-201.11    Separation.\***

6                    POISONOUS OR TOXIC MATERIALS shall be stored so they can not  
 7                    contaminate FOOD, EQUIPMENT, UTENSILS, LINENS, and SINGLE-SERVICE  
 8                    and SINGLE-USE ARTICLES by:

9                    (A)    Separating the POISONOUS OR TOXIC MATERIALS by spacing or  
 10                    partitioning;<sup>S</sup> and

11                    (B)    Locating the POISONOUS OR TOXIC MATERIALS in an area  
 12                    that is not above FOOD, EQUIPMENT, UTENSILS, LINENS, and  
 13                    SINGLE-SERVICE OR SINGLE-USE ARTICLES. *This paragraph does*  
 14                    *not apply to EQUIPMENT and UTENSIL cleaners and SANITIZERS*  
 15                    *that are stored in WAREWASHING areas for availability and*  
 16                    *convenience if the materials are stored to prevent*  
 17                    *contamination of FOOD, EQUIPMENT, UTENSILS, LINENS, and*  
 18                    *SINGLE-SERVICE and SINGLE-USE ARTICLES.*

19   **Presence and    7-202.11    Restriction.\***  
 20   **Use**

21                    (A)    Only those POISONOUS OR TOXIC MATERIALS that are  
 22                    required for the operation and maintenance of a FOOD  
 23                    ESTABLISHMENT, such as for the cleaning and SANITIZING of  
 24                    EQUIPMENT and UTENSILS and the control of insects and  
 25                    rodents, shall be allowed in a FOOD ESTABLISHMENT.<sup>S</sup>

26                    (B)    *Paragraph (A) of this section does not apply to PACKAGED*  
 27                    *POISONOUS OR TOXIC MATERIALS that are for retail sale.*

28                    **7-202.12    Conditions of Use.\***

29                    POISONOUS OR TOXIC MATERIALS shall be:

30                    (A)    Used according to:

                  (1)    LAW and this Code,

- 1 (2) Manufacturer's use directions included in labeling, and,  
 2 for a pesticide, manufacturer's label instructions that  
 3 state that use is allowed in a FOOD ESTABLISHMENT,  
 4 (3) The conditions of certification, if certification is  
 5 required, for use of the pest control materials, and  
 6 (4) Additional conditions that may be established by the  
 7 REGULATORY AUTHORITY; and  
 8 (B) Applied so that:  
 9 (1) A HAZARD to EMPLOYEES or other PERSONS is not  
 10 constituted, and  
 11 (2) Contamination including toxic residues due to drip,  
 12 drain, fog, splash or spray on FOOD, EQUIPMENT,  
 13 UTENSILS, LINENS, and SINGLE-SERVICE and SINGLE-USE  
 14 ARTICLES is prevented, and for a RESTRICTED USE  
 15 PESTICIDE, this is achieved by:  
 16 (a) Removing the items,  
 17 (b) Covering the items with impermeable covers,  
 18 or  
 19 (c) Taking other appropriate preventive actions,  
 20 and  
 21 (d) Cleaning and SANITIZING EQUIPMENT and UTENSILS  
 22 after the application.  
 23 C) A RESTRICTED USE PESTICIDE shall be applied only by an  
 24 applicator certified as defined in 7 USC 136 Definitions, (e)  
 25 Certified Applicator, of the Federal Insecticide, Fungicide,  
 26 and Rodenticide Act, or a PERSON under the direct  
 27 supervision of a certified applicator.

**Container****7-203.11 Poisonous or Toxic Material Containers.\*****Prohibitions**

A container previously used to store POISONOUS OR TOXIC MATERIALS may not be used to store, transport, or dispense FOOD.

**1 Chemicals****7-204.11 Sanitizers, Criteria.\***

2 Chemical SANITIZERS and other chemical antimicrobials applied to  
3 FOOD-CONTACT SURFACES shall meet the requirements specified in  
4 40 CFR 180.940 Tolerance exemptions for active and inert  
5 ingredients for use in antimicrobial formulations (food-contact  
6 surface sanitizing solutions).

**7 7-204.12 Chemicals for Washing Fruits and Vegetables,  
8 Criteria.\***

9 Chemicals used to wash or peel raw, whole fruits and vegetables  
10 shall meet the requirements specified in 21 CFR 173.315 Chemicals  
11 used in washing or to assist in the peeling of fruits and  
12 vegetables.

**13 7-204.13 Boiler Water Additives, Criteria.\***

14 Chemicals used as boiler water ADDITIVES shall meet the  
15 requirements specified in 21 CFR 173.310 Boiler water additives.

**16 7-204.14 Drying Agents, Criteria.\***

17 Drying agents used in conjunction with SANITIZATION shall:

18 (A) Contain only components that are listed as one of the  
19 following:

20 (1) Generally recognized as safe for use in FOOD as  
21 specified in 21 CFR 182 - Substances Generally  
22 Recognized as Safe, or 21 CFR 184 - Direct Food  
23 Substances Affirmed as Generally Recognized as  
24 Safe,

25 (2) Generally recognized as safe for the intended use  
26 as specified in 21 CFR 186 - Indirect Food  
27 Substances Affirmed as Generally Recognized as  
28 Safe,

29 (3) APPROVED for use as a drying agent under a prior  
30 sanction specified in 21 CFR 181 - Prior-Sanctioned

1 Food Ingredients,

2 (4) Specifically regulated as an indirect FOOD ADDITIVE  
3 for use as a drying agent as specified in 21 CFR  
4 Parts 175-178, or

5 (5) APPROVED for use as a drying agent under the  
6 threshold of regulation process established by 21  
7 CFR 170.39 Threshold of regulation for substances  
8 used in food-contact articles; and

9 (B) When SANITIZATION is with chemicals, the approval required  
10 under Subparagraph (A)(3) or (A)(5) of this section or the  
11 regulation as an indirect FOOD ADDITIVE required under  
12 Subparagraph (A)(4) of this section, shall be specifically for  
13 use with chemical SANITIZING solutions.

14 **Lubricants**

**7-205.11 Incidental Food Contact, Criteria.\***

15 Lubricants shall meet the requirements specified in 21 CFR  
16 178.3570 Lubricants with incidental food contact, if they are used  
17 on FOOD-CONTACT SURFACES, on bearings and gears located on or  
18 within FOOD-CONTACT SURFACES, or on bearings and gears that are  
19 located so that lubricants may leak, drip, or be forced into FOOD or  
20 onto FOOD-CONTACT SURFACES.

21 **Pesticides**

**7-206.11 Restricted Use Pesticides, Criteria.\***

22 RESTRICTED USE PESTICIDES specified under ¶ 7-202.12(C) shall meet  
23 the requirements specified in 40 CFR 152 Subpart I -  
24 Classification of Pesticides.

25 **7-206.12 Rodent Bait Stations.\***

26 Rodent bait shall be contained in a covered, tamper-resistant bait  
27 station.

28 **7-206.13 Tracking Powders, Pest Control and Monitoring.\***

29 (A) Except as specified in ¶ (B) of this section, a tracking  
30 powder pesticide may not be used in a FOOD

1 ESTABLISHMENT.

2 (B) If used, a nontoxic tracking powder such as talcum or flour  
3 may not contaminate FOOD, EQUIPMENT, UTENSILS, LINENS, and  
4 SINGLE-SERVICE and SINGLE-USE ARTICLES.<sup>N</sup>

5 **Medicines** **7-207.11 Restriction and Storage.\***

6 (A) *Except for medicines that are stored or displayed for retail*  
7 *sale,* only those medicines that are necessary for the  
8 health of EMPLOYEES shall be allowed in a FOOD  
9 ESTABLISHMENT.

10 (B) Medicines that are in a FOOD ESTABLISHMENT for the  
11 EMPLOYEES' use shall be labeled as specified under §  
12 7-101.11 and located to prevent the contamination of FOOD,  
13 EQUIPMENT, UTENSILS, LINENS, and SINGLE-SERVICE and SINGLE-  
14 USE ARTICLES.

15 **7-207.12 Refrigerated Medicines, Storage.\***

16 Medicines belonging to EMPLOYEES or to children in a day care  
17 center that require refrigeration and are stored in a FOOD  
18 refrigerator shall be:

19 (A) Stored in a package or container and kept inside a  
20 covered, leakproof container that is identified as a  
21 container for the storage of medicines; and

22 (B) Located so they are inaccessible to children.

23 **First Aid** **7-208.11 Storage.\***

24 **Supplies** First aid supplies that are in a FOOD ESTABLISHMENT for the  
25 EMPLOYEES' use shall be:

26 (A) Labeled as specified under § 7-101.11;<sup>S</sup> and

27 (B) Stored in a kit or a container that is located to prevent the  
28 contamination of FOOD, EQUIPMENT, UTENSILS, and LINENS, and  
29 SINGLE-SERVICE and SINGLE-USE ARTICLES.<sup>S</sup>

30 **Other Personal** **7-209.11 Storage.**

1 **Care Items** Except as specified under §§ 7-207.12 and 7-208.11, EMPLOYEES  
2 shall store their PERSONAL CARE ITEMS in facilities as specified under  
3 ¶ 6-305.11(B).

4 **7-3 STOCK AND RETAIL SALE**

5 **Subpart**

6 **7-301 Storage and Display**

8 **Storage and 7-301.11 Separation.\***

9 **Display** POISONOUS or TOXIC MATERIALS shall be stored and displayed for  
10 retail sale so they can not contaminate FOOD, EQUIPMENT, UTENSILS,  
11 LINENS, and SINGLE-SERVICE and SINGLE-USE ARTICLES by:

12 (A) Separating the POISONOUS or TOXIC MATERIALS by spacing or  
13 partitioning;<sup>5</sup> and

14 (B) Locating the POISONOUS OR TOXIC MATERIALS in an area  
15 that is not above FOOD, EQUIPMENT, UTENSILS, LINENS, and  
16 SINGLE-SERVICE or SINGLE-USE ARTICLES.

16

17 ***Use for* 8-101.10 Public Health Protection.**18 ***Intended*** (A) The REGULATORY AUTHORITY shall apply this Code to  
19 ***Purpose*** promote its underlying purpose, as specified in §1-102.10,  
20 of safeguarding public health and ensuring that FOOD is  
21 safe, UNADULTERATED, and honestly presented when  
22 offered to the CONSUMER.23 (B) In enforcing the provisions of this Code, the REGULATORY  
24 AUTHORITY shall assess existing facilities or EQUIPMENT that  
25 were in use before the effective date of this Code based  
26 on the following considerations:27 (1) Whether the facilities or EQUIPMENT are in good  
28 repair and capable of being maintained in a

sanitary condition;

(2) Whether FOOD-CONTACT SURFACES comply with Subpart 4-101;

(3) Whether the capacities of cooling, heating, and holding EQUIPMENT are sufficient to comply with § 4-301.11; and

(4) The existence of a documented agreement with the PERMIT HOLDER that the facilities or EQUIPMENT will be replaced as specified under ¶ 8-304.11(G) or upgraded or replaced as specified under ¶ 8-304.11(H).

**Additional Requirements**

**8-102.10 Preventing Health Hazards, Provision for Conditions Not Addressed.**

(A) If necessary to protect against public health HAZARDS or nuisances, the REGULATORY AUTHORITY may impose specific requirements in addition to the requirements contained in this Code that are authorized by LAW.

(B) The REGULATORY AUTHORITY shall document the conditions that necessitate the imposition of additional requirements and the underlying public health rationale. The documentation shall be provided to the PERMIT applicant or PERMIT HOLDER and a copy shall be maintained in the REGULATORY AUTHORITY'S file for the FOOD ESTABLISHMENT.

**Variations**

**8-103.10 Modifications and Waivers.**

The REGULATORY AUTHORITY may grant a VARIANCE by modifying or waiving the requirements of this Code if in the opinion of the REGULATORY AUTHORITY a health HAZARD or nuisance will not result from the VARIANCE. If a VARIANCE is granted, the REGULATORY AUTHORITY shall retain the information specified under § 8-103.11 in its records for the FOOD ESTABLISHMENT.

**8-103.11 Documentation of Proposed Variance and**

**Justification.**

Before a VARIANCE from a requirement of this Code is APPROVED, the information that shall be provided by the PERSON requesting the VARIANCE and retained in the REGULATORY AUTHORITY'S file on the FOOD ESTABLISHMENT includes:

- (A) A statement of the proposed VARIANCE of the Code requirement citing relevant Code section numbers;
- (B) An analysis of the rationale for how the potential public health HAZARDS and nuisances addressed by the relevant Code sections will be alternatively addressed by the proposal; and
- (C) A HACCP PLAN if required as specified under ¶ 8-201.13(A) that includes the information specified under § 8-201.14 as it is relevant to the VARIANCE requested.

**8-103.12 Conformance with Approved Procedures.\***

If the REGULATORY AUTHORITY grants a VARIANCE as specified in § 8-103.10, or a HACCP PLAN is otherwise required as specified under § 8-201.13, the PERMIT HOLDER shall:

- (A) Comply with the HACCP PLANS and procedures that are submitted as specified under § 8-201.14 and APPROVED as a basis for the modification or waiver; and
- (B) Maintain and provide to the REGULATORY AUTHORITY, upon request, records specified under ¶¶ 8-201.14(D) and (E) that demonstrate that the following are routinely employed;
  - (1) Procedures for monitoring the CRITICAL CONTROL POINTS,
  - (2) Monitoring of the CRITICAL CONTROL POINTS,
  - (3) Verification of the effectiveness of the operation or process, and
  - (4) Necessary corrective actions if there is failure at a CRITICAL CONTROL POINT.

## 8-2 PLAN SUBMISSION AND APPROVAL

### *Subparts*

- 8-201 Facility and Operating Plans
- 8-202 Confidentiality
- 8-203 Construction Inspection and Approval

#### ***Facility and Operating Plans* 8-201.11 When Plans Are Required.**

A PERMIT applicant or PERMIT HOLDER shall submit to the REGULATORY AUTHORITY properly prepared plans and specifications for review and approval before:

- (A) The construction of a FOOD ESTABLISHMENT;
- (B) The conversion of an existing structure for use as a FOOD ESTABLISHMENT; or
- (C) The remodeling of a FOOD ESTABLISHMENT or a change of type of FOOD ESTABLISHMENT or FOOD operation as specified under ¶ 8-302.14(C) if the REGULATORY AUTHORITY determines that plans and specifications are necessary to ensure compliance with this Code.

#### **8-201.12 Contents of the Plans and Specifications.**

The plans and specifications for a FOOD ESTABLISHMENT, including a FOOD ESTABLISHMENT specified under §8-201.13, shall include, as required by the REGULATORY AUTHORITY based on the type of operation, type of FOOD preparation, and FOODS prepared, the following information to demonstrate conformance with Code provisions:

- (A) Intended menu;
- (B) Anticipated volume of FOOD to be stored, prepared, and sold or served;
- (C) Proposed layout, mechanical schematics, construction

1 materials, and finish schedules;

2 (D) Proposed EQUIPMENT types, manufacturers, model numbers,  
3 locations, dimensions, performance capacities, and  
4 installation specifications;

5 (E) Evidence that standard procedures that ensure compliance  
6 with the requirements of this Code are developed or are  
7 being developed; and

8 (F) Other information that may be required by the REGULATORY  
9 AUTHORITY for the proper review of the proposed construction,  
10 conversion or modification, and procedures for operating a  
11 FOOD ESTABLISHMENT.

### 12 **8-201.13 When a HACCP Plan is Required.**

13 (A) Before engaging in an activity that requires a HACCP  
14 PLAN, a PERMIT applicant or PERMIT HOLDER shall submit to  
15 the REGULATORY AUTHORITY for approval a properly prepared  
16 HACCP PLAN as specified under § 8-201.14 and the  
17 relevant provisions of this Code if:

18 (1) Submission of a HACCP PLAN is required according  
19 to LAW;

20 (2) A VARIANCE is required as specified under  
21 Subparagraph 3-401.11(D)(3), § 3-502.11, or  
22 ¶ 4-204.110(B);

23 (3) The REGULATORY AUTHORITY determines that a FOOD  
24 preparation or processing method requires a VARIANCE  
25 based on a plan submittal specified under §  
26 8-201.12, an inspectional finding, or a VARIANCE  
27 request.

28 (B) A PERMIT applicant or PERMIT HOLDER shall have a properly  
29 prepared HACCP PLAN as specified under § 3-502.12.

### 30 **8-201.14 Contents of a HACCP Plan.**

1 For a FOOD ESTABLISHMENT that is required under § 8-201.13 to  
2 have a HACCP PLAN, the plan and specifications shall indicate:

3 (A) A categorization of the types of POTENTIALLY HAZARDOUS FOODS  
4 (TIME/TEMPERATURE CONTROL FOR SAFETY FOODS) that are  
5 specified in the menu such as soups and sauces, salads,  
6 and bulk, solid FOODS such as MEAT roasts, or of other  
7 FOODS that are specified by the REGULATORY AUTHORITY;

8 (B) A flow diagram by specific FOOD or category type  
9 identifying CRITICAL CONTROL POINTS and providing information  
10 on the following:

11 (1) Ingredients, materials, and EQUIPMENT used in the  
12 preparation of that FOOD, and

13 (2) Formulations or recipes that delineate methods and  
14 procedural control measures that address the FOOD  
15 safety concerns involved;

16 (C) FOOD EMPLOYEE and supervisory training plan that  
17 addresses the FOOD safety issues of concern;

18 (D) A statement of standard operating procedures for the plan  
19 under consideration including clearly identifying:

20 (1) Each CRITICAL CONTROL POINT,

21 (2) The CRITICAL LIMITS for each CRITICAL CONTROL POINT,

22 (3) The method and frequency for monitoring and  
23 controlling each CRITICAL CONTROL POINT by the FOOD  
24 EMPLOYEE designated by the PERSON IN CHARGE,

25 (4) The method and frequency for the PERSON IN CHARGE  
26 to routinely verify that the FOOD EMPLOYEE is  
27 following standard operating procedures and monitoring  
28 CRITICAL CONTROL POINTS,

29 (5) Action to be taken by the PERSON IN CHARGE if the  
30 CRITICAL LIMITS for each CRITICAL CONTROL POINT are

1 not met, and

2 (6) Records to be maintained by the PERSON IN CHARGE  
3 to demonstrate that the HACCP PLAN is properly  
4 operated and managed; and

5 (E) Additional scientific data or other information, as required  
6 by the REGULATORY AUTHORITY, supporting the determination  
7 that FOOD safety is not compromised by the proposal.

8 **Confidentiality 8-202.10 Trade Secrets.**

9 The REGULATORY AUTHORITY shall treat as confidential in  
10 accordance with LAW, information that meets the criteria  
11 specified in LAW for a trade secret and is contained on  
12 inspection report forms and in the plans and specifications  
13 submitted as specified under §§ 8-201.12 and 8-201.14.

14 **Construction 8-203.10 Preoperational Inspections.**

15 **Inspection**  
16 **and Approval**

17 The REGULATORY AUTHORITY shall conduct one or more pre-  
18 operational inspections to verify that the FOOD ESTABLISHMENT is  
19 constructed and equipped in accordance with the APPROVED  
20 plans and APPROVED modifications of those plans, has established  
21 standard operating procedures as specified under ¶ 8-201.12(E),  
and is in compliance with LAW and this Code.

22 **8-3 PERMIT TO OPERATE**

23 **Subparts**

24 **8-301 Requirement**

25 **8-302 Application Procedure**

26 **8-303 Issuance**

27 **8-304 Conditions of Retention**

28 **Requirement 8-301.11 Prerequisite for Operation.**

29 A PERSON may not operate a FOOD ESTABLISHMENT without a valid  
30 PERMIT to operate issued by the REGULATORY AUTHORITY.

1    **Application**                    **8-302.11    Submission 30 Calendar Days Before Proposed**  
2    **Procedure**                     **Opening.**

3            An applicant shall submit an application for a PERMIT at least  
4            30 calendar days before the date planned for opening a FOOD  
5            ESTABLISHMENT. The REGULATORY AUTHORITY may accept an  
6            application for a PERMIT that is less than the minimum 30  
7            calendar days before the date planned for opening a FOOD  
8            ESTABLISHMENT provided the necessary fees and other  
9            requirements established by the REGULATORY AUTHORITY are met  
10           by the applicant.

11           **8-302.12    Form of Submission.**

12           A PERSON desiring to operate a FOOD ESTABLISHMENT shall submit  
13           to the REGULATORY AUTHORITY a written application for a PERMIT  
14           on a form provided by the REGULATORY AUTHORITY.

15           **8-302.13    Qualifications and Responsibilities of Applicants.**

16           To qualify for a PERMIT, an applicant shall:

- 17           (A) Be an owner of the FOOD ESTABLISHMENT or an officer of  
18           the legal ownership;  
19           (B) Comply with the requirements of this Code;  
20           (C) As specified under § 8-402.11, agree to allow access to  
21           the FOOD ESTABLISHMENT and to provide required  
22           information; and  
23           (D) Pay the applicable PERMIT fees at the time the  
24           application is submitted.

25           **8-302.14    Contents of the Application.**

26           The application shall include:

- 27           (A) The name, birth date, mailing address, telephone number,  
28           and signature of the PERSON applying for the PERMIT and  
29           the name, mailing address, and location of the FOOD  
30           ESTABLISHMENT;

- 1 (B) Information specifying whether the FOOD ESTABLISHMENT is  
2 owned by an association, corporation, individual,  
3 partnership, or other legal entity;
- 4 (C) A statement specifying whether the FOOD ESTABLISHMENT:  
5 (1) Is mobile or stationary and temporary or  
6 permanent, and  
7 (2) Is an operation that includes one or more of the  
8 following:
- 9 (a) Prepares, offers for sale, or serves POTENTIALLY  
10 HAZARDOUS FOOD (TIME/TEMPERATURE CONTROL FOR  
11 SAFETY FOOD):  
12 (i) Only to order upon a CONSUMER'S  
13 request,  
14 (ii) In advance in quantities based on  
15 projected CONSUMER demand and  
16 discards FOOD that is not sold or  
17 served at an APPROVED frequency, or  
18 (iii) Using time as the public health  
19 control as specified under § 3-501.19,
- 20 (b) Prepares POTENTIALLY HAZARDOUS FOOD  
21 (TIME/TEMPERATURE CONTROL FOR SAFETY FOOD)  
22 in advance using a FOOD preparation method  
23 that involves two or more steps which may  
24 include combining POTENTIALLY HAZARDOUS  
25 (TIME/TEMPERATURE CONTROL FOR SAFETY FOOD)  
26 ingredients; cooking; cooling; reheating; hot  
27 or cold holding; freezing; or thawing,
- 28 (c) Prepares FOOD as specified under  
29 Subparagraph (C)(2)(b) of this section for  
30 delivery to and consumption at a location off

- 1 the PREMISES of the FOOD ESTABLISHMENT where  
2 it is prepared,
- 3 (d) Prepares FOOD as under Subparagraph  
4 (C)(2)(b) of this section for service to a  
5 HIGHLY SUSCEPTIBLE POPULATION,
- 6 (e) Prepares only FOOD that is not POTENTIALLY  
7 HAZARDOUS (TIME/TEMPERATURE CONTROL OF  
8 SAFETY FOOD), or
- 9 (f) Does not prepare, but offers for sale only  
10 prePACKAGED FOOD that is not POTENTIALLY  
11 HAZARDOUS (TIME/TEMPERATURE CONTROL FOR  
12 SAFETY FOOD);
- 13 (D) The name, title, address, and telephone number of the  
14 PERSON directly responsible for the FOOD ESTABLISHMENT;
- 15 (E) The name, title, address, and telephone number of the  
16 PERSON who functions as the immediate supervisor of the  
17 PERSON specified under ¶ (D) of this section such as the  
18 zone, district, or regional supervisor;
- 19 (F) The names, titles, and addresses of:
- 20 (1) The PERSONS comprising the legal ownership as  
21 specified under ¶ (B) of this section including the  
22 owners and officers, and
- 23 (2) The local resident agent if one is required based  
24 on the type of legal ownership;
- 25 (G) A statement signed by the applicant that:
- 26 (1) Attests to the accuracy of the information provided  
27 in the application, and
- 28 (2) Affirms that the applicant will:
- 29 (a) Comply with this Code, and  
30 (b) Allow the REGULATORY AUTHORITY access to

the establishment as specified under § 8-402.11 and to the records specified under §§ 3-203.12 and 5-205.13 and Subparagraph 8-201.14(D)(6); and

(H) Other information required by the REGULATORY AUTHORITY.

**Issuance 8-303.10 New, Converted, or Remodeled Establishments.**

For FOOD ESTABLISHMENTS that are required to submit plans as specified under § 8-201.11 the REGULATORY AUTHORITY shall issue a PERMIT to the applicant after:

- (A) A properly completed application is submitted;
- (B) The required fee is submitted;
- (C) The required plans, specifications, and information are reviewed and APPROVED; and
- (D) A preoperational inspection as specified in § 8-203.10 shows that the establishment is built or remodeled in accordance with the APPROVED plans and specifications and that the establishment is in compliance with this Code.

**8-303.20 Existing Establishments, Permit Renewal, and Change of Ownership.**

The REGULATORY AUTHORITY may renew a PERMIT for an existing FOOD ESTABLISHMENT or may issue a PERMIT to a new owner of an existing FOOD ESTABLISHMENT after a properly completed application is submitted, reviewed, and APPROVED, the fees are paid, and an inspection shows that the establishment is in compliance with this Code.

**8-303.30 Denial of Application for Permit, Notice.**

If an application for a PERMIT to operate is denied, the REGULATORY AUTHORITY shall provide the applicant with a notice that includes:

- 1 (A) The specific reasons and Code citations for the PERMIT
- 2 denial;
- 3 (B) The actions, if any, that the applicant must take to
- 4 qualify for a PERMIT; and
- 5 (C) Advisement of the applicant's right of appeal and the
- 6 process and time frames for appeal that are provided
- 7 in LAW.

8 **Conditions of**  
 9 **Retention**

**8-304.10 Responsibilities of the Regulatory Authority**

- 10 (A) At the time a PERMIT is first issued, the REGULATORY AUTHORITY
- 11 shall inform the PERMIT HOLDER about the Code so that
- 12 the PERMIT HOLDER is notified of the compliance
- 13 requirements and the conditions of retention, as specified
- 14 under § 8-304.11, that are applicable to the PERMIT.
- 15 (B) *Failure to provide the information specified in ¶(A) of this*
- 16 *section does not prevent the REGULATORY AUTHORITY from*
- 17 *taking authorized action or seeking remedies if the PERMIT*
- 18 *HOLDER fails to comply with this Code or an order,*
- 19 *warning, or directive of the REGULATORY AUTHORITY.*

**8-304.11 Responsibilities of the Permit Holder.**

20 Upon acceptance of the PERMIT issued by the REGULATORY  
 21 AUTHORITY, the PERMIT HOLDER in order to retain the PERMIT shall:

- 22 (A) Post the PERMIT in a location in the FOOD ESTABLISHMENT
- 23 that is conspicuous to CONSUMERS;
- 24 (B) Comply with the provisions of this Code including the
- 25 conditions of a granted VARIANCE as specified under
- 26 § 8-103.12, and APPROVED plans as specified under
- 27 § 8-201.12;
- 28 (C) If a FOOD ESTABLISHMENT is required under § 8-201.13 to
- 29 operate under a HACCP PLAN, comply with the plan as
- 30 specified under § 8-103.12;

- 1 (D) Immediately contact the REGULATORY AUTHORITY to report an  
2 illness of a FOOD EMPLOYEE or CONDITIONAL EMPLOYEE as  
3 specified under ¶ 2-201.11(B);
- 4 (E) Immediately discontinue operations and notify the  
5 REGULATORY AUTHORITY if an IMMINENT HEALTH HAZARD may exist  
6 as specified under § 8-404.11;
- 7 (F) Allow representatives of the REGULATORY AUTHORITY access  
8 to the FOOD ESTABLISHMENT as specified under  
9 § 8-402.11;
- 10 (G) Except as specified under ¶ (H) of this section, replace  
11 existing facilities and EQUIPMENT specified in § 8-101.10  
12 with facilities and EQUIPMENT that comply with this Code  
13 if:
- 14 (1) The REGULATORY AUTHORITY directs the replacement  
15 because the facilities and EQUIPMENT constitute a  
16 public health HAZARD or nuisance or no longer  
17 comply with the criteria upon which the facilities  
18 and EQUIPMENT were accepted,
- 19 (2) The REGULATORY AUTHORITY directs the replacement of  
20 the facilities and EQUIPMENT because of a change  
21 of ownership, or
- 22 (3) The facilities and EQUIPMENT are replaced in the  
23 normal course of operation;
- 24 (H) Upgrade or replace refrigeration EQUIPMENT as specified  
25 under Subparagraph 3-501.16(A)(2)(b), if the  
26 circumstances specified under Subparagraphs (G)(1) - (3)  
27 of this section do not occur first, and 5 years pass after  
28 the REGULATORY AUTHORITY adopts this Code;
- 29 (I) Comply with directives of the REGULATORY AUTHORITY  
30 including time frames for corrective actions specified in

1 inspection reports, notices, orders, warnings, and other  
 2 directives issued by the REGULATORY AUTHORITY in regard to  
 3 the PERMIT HOLDER'S FOOD ESTABLISHMENT or in response  
 4 to community emergencies;

5 (J) Accept notices issued and served by the REGULATORY  
 6 AUTHORITY according to LAW; and

7 (K) Be subject to the administrative, civil, injunctive, and  
 8 criminal remedies authorized in LAW for failure to comply  
 9 with this Code or a directive of the REGULATORY  
 10 AUTHORITY, including time frames for corrective actions  
 11 specified in inspection reports, notices, orders, warnings,  
 12 and other directives.

13 **8-304.20 Permits Not Transferable.**

14 A PERMIT shall not be transferred from one PERSON to another  
 15 PERSON, from one FOOD ESTABLISHMENT to another, or from one  
 16 type of operation to another if the FOOD operation changes  
 17 from the type of operation specified in the application as  
 18 specified under ¶ 8-302.14(C) and the change in operation is  
 19 not APPROVED.

20  
 21 **8-4 INSPECTION AND CORRECTION OF VIOLATIONS**

22 ***Subparts***

- 23 **8-401 Frequency**  
 24 **8-402 Access**  
 25 **8-403 Report of Findings**  
 26 **8-404 Imminent Health Hazard**  
 27 **8-405 Violation of Critical Item**  
 28 **8-406 Noncritical Violation**

1 **Frequency****8-401.10 Establishing Inspection Interval.**

2 (A) Except as specified in ¶¶ (B) and (C) of this section, the  
3 REGULATORY AUTHORITY shall inspect a FOOD ESTABLISHMENT at  
4 least once every 3 months.

5 (B) *The REGULATORY AUTHORITY may decrease the qualification*  
6 *of the inspection if: The FOOD ESTABLISHMENT is fully*  
7 *operating under an APPROVED and validated HACCP*  
8 *PLAN as specified under § 8-201.14 and ¶¶*  
9 *8-103.12(A) and (B);*

10 (2) *The establishment's operation involves only coffee*  
11 *service and other unpackaged or prePACKAGED FOOD*  
12 *that is not POTENTIALLY HAZARDOUS (TIME/TEMPERATURE*  
13 *CONTROL FOR SAFETY FOOD) such as carbonated*  
14 *BEVERAGES and snack FOOD such as chips, nuts,*  
15 *popcorn, and pretzels.*

16 (C) The REGULATORY AUTHORITY shall periodically inspect  
17 throughout its PERMIT period a TEMPORARY FOOD ESTABLISHMENT  
18 and TEMPORARY FOOD SERVICE ESTABLISHMENT that prepares,  
19 sells, or serves UNPACKAGED POTENTIALLY HAZARDOUS FOOD  
20 (TIME/TEMPERATURE CONTROL FOR SAFETY FOOD) and that:

21 (1) Has improvised rather than permanent facilities or  
22 EQUIPMENT for accomplishing functions such as  
23 handwashing, FOOD preparation and protection,  
24 FOOD temperature control, WAREWASHING, providing  
25 DRINKING WATER, waste retention and disposal, and  
26 insect and rodent control; or

27 (2) Has inexperienced FOOD EMPLOYEES.

**8-401.20 Performance- and Risk-Based.**

28 Within the parameters specified in § 8-401.10, the REGULATORY  
29 AUTHORITY shall prioritize, and conduct more frequent inspections  
30

1 based upon its assessment of a FOOD ESTABLISHMENT'S history of  
2 compliance with this Code and the establishment's potential as  
3 a vector of foodborne illness by evaluating:

- 4 (A) Past performance, for nonconformance with Code or  
5 HACCP PLAN requirements that are critical;  
6 (B) Past performance, for numerous or repeat violations of  
7 Code or HACCP PLAN requirements that are noncritical;  
8 (C) Past performance, for complaints investigated and found  
9 to be valid;  
10 (D) The HAZARDS associated with the particular FOODS that are  
11 prepared, stored, or served;  
12 (E) The type of operation including the methods and  
13 extent of FOOD storage, preparation, and service;  
14 (F) The number of people served; and  
15 (G) Whether the population served is a HIGHLY SUSCEPTIBLE  
16 POPULATION.

17 **8-402.10 Competency of Inspectors.**

18 An authorized representative of the REGULATORY AUTHORITY who  
19 inspects a FOOD ESTABLISHMENT or conducts plan review for  
20 compliance with this Code shall have the knowledge, skills,  
21 and ability to adequately perform the required duties.

22 **Access**

23 **8-402.11 Allowed at Reasonable Times after Due Notice.**

24 After the REGULATORY AUTHORITY presents official credentials and  
25 provides notice of the purpose of, and an intent to conduct, an  
26 inspection, the PERSON IN CHARGE shall allow the REGULATORY  
27 AUTHORITY to determine if the FOOD ESTABLISHMENT is in  
28 compliance with this Code by allowing access to the  
29 establishment, allowing inspection, and providing information and  
30 records specified in this Code and to which the REGULATORY  
AUTHORITY is entitled according to LAW, during the FOOD

1 ESTABLISHMENT'S hours of operation and other reasonable times.

2 **8-402.20 Refusal, Notification of Right to Access, and Final**  
3 **Request for Access.**

4 If a PERSON denies access to the REGULATORY AUTHORITY, the  
5 REGULATORY AUTHORITY shall:

6 (A) Inform the PERSON that:

7 (1) The PERMIT HOLDER is required to allow access to  
8 the REGULATORY AUTHORITY as specified under  
9 § 8-402.11 of this Code,

10 (2) Access is a condition of the acceptance and  
11 retention of a FOOD ESTABLISHMENT PERMIT to operate  
12 as specified under ¶ 8-304.11(F), and

13 (3) If access is denied, the FOOD ESTABLISHMENT PERMIT  
14 may be suspended by the REGULATORY AUTHORITY.

15 (B) Make a final request for access.

16 **8-402.30 Refusal, Reporting.**

17 If after the REGULATORY AUTHORITY presents credentials and provides  
18 notice as specified under § 8-402.11, explains the authority upon  
19 which access is requested, and makes a final request for  
20 access as specified in § 8-402.20, the PERSON IN CHARGE  
21 continues to REFUSE access, the REGULATORY AUTHORITY shall  
22 provide details of the denial of access on an inspection report  
23 form.

24 **8-402.40 Refusal, Automatic Suspension of Permit.**

25 If denied access to a FOOD ESTABLISHMENT for an authorized  
26 purpose and after complying with § 8-402.20, the REGULATORY  
27 AUTHORITY shall immediately suspend the PERMIT of the FOOD  
28 ESTABLISHMENT.

29 **8-403.10 Documenting Information and Observations.**

30 The REGULATORY AUTHORITY shall document on an inspection report

*Report of  
Findings*

1 form:

- 2 (A) Administrative information about the FOOD ESTABLISHMENT'S  
3 legal identity, street and mailing addresses, type of  
4 establishment and operation as specified under ¶  
5 8-302.14(C), inspection date, and other information such  
6 as type of water supply and SEWAGE disposal, status of  
7 the PERMIT, and personnel certificates that may be  
8 required; and
- 9 (B) Specific factual observations of violative conditions or other  
10 deviations from this Code that require correction by the  
11 PERMIT HOLDER including:
- 12 (1) Failure of the PERSON IN CHARGE to demonstrate the  
13 knowledge of foodborne illness prevention,  
14 application of HACCP principles, and the  
15 requirements of this Code as specified under §  
16 2-102.11,
- 17 (2) Failure of FOOD EMPLOYEES, CONDITIONAL EMPLOYEES, and  
18 the PERSON IN CHARGE to report a disease or medical  
19 condition as specified under ¶¶ 2-201.11(B) and (D),
- 20 (3) Nonconformance with CRITICAL ITEMS of this Code,
- 21 (4) Failure of the appropriate FOOD EMPLOYEES to  
22 demonstrate their knowledge of, and ability to  
23 perform in accordance with, the procedural,  
24 monitoring, verification, and corrective action  
25 practices required by the REGULATORY AUTHORITY as  
26 specified under § 8-103.12,
- 27 (5) Failure of the PERSON IN CHARGE to provide records  
28 required by the REGULATORY AUTHORITY for determining  
29 conformance with a HACCP PLAN as specified under  
30 Subparagraph 8-201.14(D)(6), and

- 1 (6) Nonconformance with CRITICAL LIMITS of a HACCP  
2 PLAN.

3 **8-403.11 Grading of Food Establishment**

4 (a) Every FOOD ESTABLISHMENT shall display in a place  
5 designated by the REGULATORY AUTHORITY, a placard  
6 stating the grade received at the time of the most  
7 recent inspection of the establishment. Only the  
8 REGULATORY AUTHORITY may issue, move, or remove such  
9 placard.

10 (b) TEMPORARY FOOD ESTABLISHMENT shall not be subject to  
11 grading.

12 (c) Grades of FOOD ESTABLISHMENT shall be as follows:

13 1) Grade A. A FOOD ESTABLISHMENT having a demerit  
14 score of not more than ten (10).

15 2) Grade B. A FOOD ESTABLISHMENT having a demerit  
16 score of more than ten (10) but no more than  
17 twenty (20).

18 3) Grade C. A FOOD ESTABLISHMENT having a demerit  
19 score of more than twenty (20) but no more than  
20 forty (40). Notwithstanding the grade criteria  
21 established above, whenever a second consecutive  
22 violation of the same item of 2, 4, or 6 demerit  
23 points is discovered, the PERMIT may be  
24 suspended, or in lieu thereof, the FOOD  
25 ESTABLISHMENT shall be downgraded to the next  
26 lower grade.

27 (d) Immediately following such inspection, the REGULATORY  
28 AUTHORITY shall post the appropriate grade at the FOOD  
29 ESTABLISHMENT.

30 **8-403.30 Issuing Report and Obtaining Acknowledgment of**

**Receipt.**

At the conclusion of the inspection and according to LAW, the REGULATORY AUTHORITY shall provide a copy of the completed inspection report and the notice to correct violations to the PERMIT HOLDER or to the PERSON IN CHARGE, and request a signed acknowledgment of receipt.

**8-403.40 Refusal to Sign Acknowledgment.**

The REGULATORY AUTHORITY shall:

(A) Inform a PERSON who declines to sign an acknowledgment of receipt of inspectional findings as specified in § 8-403.30 that:

- (1) An acknowledgment of receipt is not an agreement with findings,
- (2) Refusal to sign an acknowledgment of receipt will not affect the PERMIT HOLDER'S obligation to correct the violations noted in the inspection report within the time frames specified, and
- (3) A refusal to sign an acknowledgment of receipt is noted in the inspection report and conveyed to the REGULATORY AUTHORITY'S historical record for the FOOD ESTABLISHMENT; and

(B) Make a final request that the PERSON IN CHARGE sign an acknowledgment receipt of inspectional findings.

**8-403.50 Public Information.**

Except as specified in § 8-202.10, the REGULATORY AUTHORITY shall treat the inspection report as a public document and shall make it available for disclosure to a PERSON who requests it as provided in LAW.

***Imminent Health Hazard* 8-404.11 Ceasing Operations and Reporting.**

(A) Except as specified in ¶ (B) of this section, a PERMIT

1 HOLDER shall immediately discontinue operations and notify  
 2 the REGULATORY AUTHORITY if an IMMINENT HEALTH HAZARD  
 3 may exist because of an emergency such as a fire,  
 4 flood, extended interruption of electrical or water service,  
 5 SEWAGE backup, misuse of POISONOUS OR TOXIC MATERIALS,  
 6 onset of an apparent foodborne illness outbreak, gross  
 7 insanitary occurrence or condition, or other circumstance  
 8 that may endanger public health.

9 B) *A PERMIT HOLDER need not discontinue operations in an*  
 10 *area of an establishment that is unaffected by the*  
 11 *IMMINENT HEALTH HAZARD.*

#### 12 **8-404.12 Resumption of Operations.**

13 If operations are discontinued as specified under § 8-404.11 or  
 14 otherwise according to LAW, the PERMIT HOLDER shall obtain  
 15 approval from the REGULATORY AUTHORITY before resuming operations.

#### 16 **Violation of** 17 **Critical** 18 **Item**

#### 19 **8-405.11 Timely Correction.**

20 (A) Except as specified in ¶(B) of this section, a PERMIT  
 21 HOLDER shall at the time of inspection correct a violation  
 22 of a CRITICAL ITEM of this Code and implement corrective  
 23 actions for a HACCP PLAN provision that is not in  
 24 compliance with its CRITICAL LIMIT

25 (B) *Considering the nature of the potential HAZARD involved*  
 26 *and the complexity of the corrective action needed, the*  
 27 *REGULATORY AUTHORITY may agree to or specify a longer*  
 28 *time frame, not to exceed 10 calendar days after the*  
 29 *inspection, for the PERMIT HOLDER to correct violations*  
 30 *of a CRITICAL ITEM or HACCP PLAN deviations.*

#### 31 **8-405.20 Verification and Documentation of Correction.**

32 (A) After observing at the time of inspection a correction of a  
 33 violation of a CRITICAL ITEM or deviation, the REGULATORY

1 AUTHORITY shall enter the violation and information about  
2 the corrective action on the inspection report.

3 (B) As specified under ¶ 8-405.11(B), after receiving  
4 notification that the PERMIT HOLDER has corrected a  
5 violation of a CRITICAL ITEM or HACCP PLAN deviation, or  
6 at the end of the specified period of time, the  
7 REGULATORY AUTHORITY shall verify correction of the  
8 violation, document the information on an inspection  
9 report, and enter the report in the REGULATORY AUTHORITY'S  
10 records.

11 ***Noncritical***            **8-406.11 Time Frame for Correction.**

12 ***Violation***

13 (A) Except as specified in ¶ (B) of this section, the PERMIT  
14 HOLDER shall correct noncritical violations by a date and  
15 time agreed to or specified by the REGULATORY AUTHORITY  
16 but no later than 30 calendar days after the inspection.

17 (B) *The REGULATORY AUTHORITY may approve a compliance*  
18 *schedule that extends beyond the time limits specified*  
19 *under ¶ (A) of this section if a written schedule of*  
20 *compliance is submitted by the PERMIT HOLDER and no*  
21 *health HAZARD exists or will result from allowing an*  
22 *extended schedule for compliance.*

23 **8-5 PREVENTION OF FOODBORNE DISEASE TRANSMISSION BY**  
24 **EMPLOYEES**

25 ***Subpart***

26 **8-501 Investigation and Control**

27  
28 ***Investigation***            **8-501.10 Obtaining Information: Personal History of**  
29 ***and Control***            **Illness, Medical Examination, and Specimen**  
30 **Analysis.**

1 The REGULATORY AUTHORITY shall act when it has reasonable  
2 cause to believe that a FOOD EMPLOYEE or CONDITIONAL  
3 EMPLOYEE has possibly transmitted disease; may be infected  
4 with a disease in a communicable form that is transmissible  
5 through FOOD; may be a carrier of infectious agents that  
6 cause a disease that is transmissible through FOOD; or is  
7 affected with a boil, an infected wound, or acute respiratory  
8 infection, by:

- 9 (A) Securing a confidential medical history of the FOOD  
10 EMPLOYEE or CONDITIONAL EMPLOYEE suspected of transmitting  
11 disease or making other investigations as deemed  
12 appropriate; and  
13 (B) Requiring appropriate medical examinations, including  
14 collection of specimens for laboratory analysis, of a  
15 suspected FOOD EMPLOYEE or CONDITIONAL EMPLOYEE.

16 **8-501.20 Restriction or Exclusion of Food Employee, or**  
17 **Summary Suspension of Permit.**

18 Based on the findings of an investigation related to a FOOD  
19 EMPLOYEE or CONDITIONAL EMPLOYEE who is suspected of being  
20 infected or diseased, the REGULATORY AUTHORITY may issue an  
21 order to the suspected FOOD EMPLOYEE, CONDITIONAL EMPLOYEE or  
22 PERMIT HOLDER instituting one or more of the following control  
23 measures:

- 24 (A) RESTRICTING the FOOD EMPLOYEE or CONDITIONAL EMPLOYEE;  
25 (B) EXCLUDING the FOOD EMPLOYEE or CONDITIONAL EMPLOYEE; or  
26 (C) Closing the FOOD ESTABLISHMENT by summarily suspending  
27 a PERMIT to operate in accordance with LAW.

28 **8-501.30 Restriction or Exclusion Order: Warning or Hearing**  
29 **Not Required, Information Required in Order.**

30 Based on the findings of the investigation as specified in

1 § 8-501.10 and to control disease transmission, the REGULATORY  
2 AUTHORITY may issue an order of RESTRICTION or EXCLUSION to a  
3 suspected FOOD EMPLOYEE or the PERMIT HOLDER without prior  
4 warning, notice of a hearing, or a hearing if the order:

5 (A) States the reasons for the RESTRICTION or EXCLUSION that is  
6 ordered;

7 (B) States the evidence that the FOOD EMPLOYEE or PERMIT  
8 HOLDER shall provide in order to demonstrate that the  
9 reasons for the RESTRICTION or EXCLUSION are  
10 eliminated;

11 (C) States that the suspected FOOD EMPLOYEE or the PERMIT  
12 HOLDER may request an appeal hearing by submitting a  
13 timely request as provided in LAW; and

14 (D) Provides the name and address of the REGULATORY  
15 AUTHORITY representative to whom a request for an  
16 appeal hearing may be made.

17 **8-501.40 Removal of Exclusions and Restrictions.**

18  
19 The REGULATORY AUTHORITY shall release a FOOD EMPLOYEE, OR  
20 CONDITIONAL EMPLOYEE from RESTRICTION or EXCLUSION according to  
21 LAW and the conditions specified under § 2-201.13.

22 **8-501.50 Examining, Sampling, and Testing Food.**

23 The REGULATORY AUTHORITY may examine, sample, and test FOOD  
24 in order to determine its compliance with this Code.

1 **Guam Annex**

2 **1 Public Health Reasons**

3 **CHAPTER 1 PURPOSE AND DEFINITIONS**

4 **CHAPTER 2 MANAGEMENT AND PERSONNEL**

5 **CHAPTER 3 FOOD**

6 **CHAPTER 4 EQUIPMENT, UTENSILS, AND LINENS**

7 **CHAPTER 5 WATER, PLUMBING, AND WASTE**

8 **CHAPTER 6 PHYSICAL FACILITIES**

9 **CHAPTER 7 POISONOUS OR TOXIC MATERIALS**

10 **CHAPTER 8 COMPLIANCE AND ENFORCEMENT**

11  
12 **Chapter 1 Purpose and Definitions**

13 **Applicability and 1-201.10 Statement of Application and Listing**  
14 **Terms Defined of Terms.**

15 **(B) Terms Defined**

16 The individual definitions in Chapter 1 are not numbered, consistent with current  
17 conventions regarding the use of plain language in drafting rules, and with use in  
18 national and international standards and some Federal regulations. This facilitates  
19 making changes to the definitions as they become necessary in subsequent  
20 editions of the Food Code. The intent of the definitions to be binding in terms of the  
21 application and interpretation of the Code is clearly stated in Chapter 1.

22 **Accredited Program.**

23 Food protection manager *certification* occurs when *individuals* demonstrate through  
24 a certification program that they have met specified food safety knowledge  
25 standards.

1 Food protection certification program *accreditation* occurs when *certification*  
2 *organizations* demonstrate through an accreditation program that they have met  
3 specified program standards.

4 Accreditation is a conformity assessment process through which organizations that  
5 certify individuals may voluntarily seek independent evaluation and listing by an  
6 accrediting agency based upon the certifying organization meeting program  
7 accreditation standards. Such accreditation standards typically relate to such  
8 factors as the certifying organization's structure, mission, policies, procedures, and  
9 the defensibility of its examination processes. These standards are intended to  
10 affirm or enhance the quality and credibility of the certification process, minimize the  
11 potential for conflicts of interest, ensure fairness to candidates for certification and  
12 others, and thereby increase public health protection.

13 Program accreditation standards known to be relevant to food protection manager  
14 certification programs include those contained in the *Standards for Accreditation of*  
15 *Food Protection Manager Certification Programs* available from the Conference for  
16 Food Protection, 1085 Denio Avenue, Gilroy, CA 95020-9206 and found at  
17 <http://www.foodprotect.org/pdf/standards.pdf>.

18 Allowing food protection managers to demonstrate their required food safety  
19 knowledge “through passing a test that is part of an accredited program” is  
20 predicated on the fact that their credentials have been issued by certifying  
21 organizations that have demonstrated conformance with rigorous and nationally  
22 recognized program standards.

23 **Food Establishment *and* a food processing plant *located within the same***  
24 ***premises of a Food Establishment***

25 Some food businesses perform operations that provide food directly to consumers  
26 as a “Food Establishment,” and also supply food to other business entities as a  
27 “Food Processing Plant.” Within such a business, those operations that provide  
28 food directly to consumers only should be considered part of a “Food  
29 Establishment” for the purposes of applying the Food Code while those operations  
30 that supply food to other business entities may be subject to other rules and

1 regulations that apply to “Food Processing Plants.” It is essential that the permit  
2 holder and persons in charge be aware that regulatory requirements and the  
3 appropriate operational practices for “Food Establishments” may differ from those  
4 for “Food Processing Plants.”

5 Some facilities and functions may be subject to different regulatory requirements  
6 depending on whether that facility or function is regulated as a “Food  
7 Establishment” or as a “Food Processing Plant,” or both. Those facilities and  
8 functions within a business that are shared by both the “Food Establishment” and  
9 “Food Processing Plant” operations, e.g., refrigeration units, dressing room and  
10 toilet facilities, food equipment, water and waste systems, pest control, might be  
11 subject to similar regulatory requirements. The Food Code is intended to apply to  
12 “food establishments.”

### 13 **Egg.**

14 The definition of egg includes avian species” shell eggs known to be commercially  
15 marketed in the United States. Also included are the eggs of quail and ratites such  
16 as ostrich.

17 Not included are baluts. Baluts are considered a delicacy among Philippine and  
18 Vietnamese populations. They are derived from fertile eggs, typically duck eggs,  
19 subjected to incubation temperatures for a period of time less than necessary for  
20 the embryo to hatch resulting in a partially formed embryo within the shell. Under  
21 the Egg Products Inspection Act (EPIA), an egg is typically considered adulterated  
22 if it has been subjected to incubation. However, in 9 CFR 590.5, baluts are  
23 specifically exempted from inspection as eggs under the EPIA.

24 In producing baluts, fertile duck eggs are incubated for approximately 18 days at a  
25 temperature of 42.5°C (108.5°F) in incubators with a relatively high humidity.  
26 (Complete development and hatching would take place in 28 days.) Under these  
27 conditions, the potential for growth of transovarian *Salmonella* organisms such as  
28 *S. Enteritidis* within the shell, and the potential for an increase in pathogenic  
29 microflora on the shell itself, are increased. Where chicken eggs are used in

1 preparing baluts, the incubation period may only be 14 days at an incubation  
2 temperature of 37°C (99°F). A balut is a potentially hazardous food  
3 (time/temperature control for safety food) subject to time/temperature management  
4 including proper cooking and hot and cold holding. Baluts are typically boiled and  
5 packed in salt before sale or service. Also, not included in this definition are the  
6 eggs of reptile species such as alligators and turtles. Alligator eggs are available  
7 for sale in some parts of the southern United States. In restaurants, the menu item  
8 “Alligator Eggs” is sometimes made of alligator egg, but other times is simply a  
9 fanciful name for a menu item that may include seafood items such as shrimp, but  
10 contains no alligator egg.

11 Sea turtle eggs have been consumed in Asian and Latin American Countries.  
12 However, turtle eggs are not mentioned in the definitions section because sea  
13 turtles (Loggerhead, East Pacific Green, Leatherback, Hawksbill, Kemp’s Ridley,  
14 and Olive Ridley) are protected by The Endangered Species Act of 1973 and  
15 therefore may not be sold or consumed. This Act, with respect to turtle eggs, is  
16 enforced by the United States Department of Interior, U.S. Fish and Wildlife  
17 Service, Washington, D.C.

### 18 **Potentially Hazardous Food (Time/Temperature Control for Safety Food)**

19 Potentially hazardous food (PHF/TCS food) is defined in terms of whether or not it  
20 requires time/temperature control for safety to limit pathogen growth or toxin  
21 formation. The term does not include foods that do not support growth but may  
22 contain a pathogenic microorganism or chemical or physical food safety hazard at a  
23 level sufficient to cause foodborne illness or injury. The progressive growth of all  
24 foodborne pathogens is considered whether slow or rapid.

25 The definition of PHF/TCS food takes into consideration pH,  $a_w$ , pH and  $a_w$   
26 interaction, heat treatment, and packaging for a relatively simple determination of  
27 whether the food requires time/temperature control for safety. If the food is heat-  
28 treated to eliminate vegetative cells, it needs to be addressed differently than a raw  
29 product with no, or inadequate, heat treatment. In addition, if the food is packaged  
30 after heat treatment to destroy vegetative cells and subsequently packaged to

1 prevent re-contamination, higher ranges of pH and/or  $a_w$  can be tolerated because  
2 remaining spore-forming bacteria are the only microbial hazards of concern. While  
3 foods will need to be cooled slightly to prevent condensation inside the package,  
4 they must be protected from contamination in an area with limited access and  
5 packaged before temperatures drop below 57°C (135°F). In some foods, it is  
6 possible that neither the pH value nor the  $a_w$  value is low enough by itself to control  
7 or eliminate pathogen growth; however, the interaction of pH and  $a_w$  may be able to  
8 accomplish it. This is an example of a hurdle technology. Hurdle technology  
9 involves several inhibitory factors being used together to control or eliminate  
10 pathogen growth, when they would otherwise be ineffective if used alone.

11 In determining if time/temperature control is required, combination products present  
12 their own challenge. A combination product is one in which there are two or more  
13 distinct food components and an interface between the two components may have a  
14 different property than either of the individual components. A determination must  
15 be made about whether the food has distinct components such as pie with meringue  
16 topping, focaccia bread, meat salads, or fettuccine alfredo with chicken or whether  
17 it has a uniform consistency such as gravies, puddings, or sauces. In these  
18 products, the pH at the interface is important in determining if the item is a  
19 PHF/TCS food.

20 A well designed inoculation study or other published scientific research should be  
21 used to determine whether a food can be held without time/temperature control  
22 when:

- 23 • process technologies other than heat are applied to destroy foodborne  
24 pathogens (e.g., irradiation, high pressure processing, pulsed light,  
25 ozonation);
- 26 • combination products are prepared; or
- 27 • other extrinsic factors (e.g., packaging/atmospheres) or intrinsic factors (e.g.,  
28 redox potential, salt content, antimicrobials) are used to control or eliminate  
29 pathogen growth.

1 Before using Tables A and B in paragraph 1-201.10(B) of the definition for  
2 “potentially hazardous food (time/temperature control for safety food)” in  
3 determining whether a food requires time/temperature control for safety (TCS),  
4 answers to the following questions should be considered:

- 5 • Is the intent to hold the food without using time or temperature control?
  - 6 ○ If the answer is No, no further action is required. The decision tree later  
7 in this Annex is not needed to determine if the item is a PHF/TCS food.
- 8 • Is the food raw, or is the food heat-treated?
- 9 • Does the food already require time/temperature control for safety by  
10 definition in paragraph 1-201.10(B)?
- 11 • Does a product history with sound scientific rationale exist indicating a safe  
12 history of use?
- 13 • Is the food processed and packaged so that it no longer requires TCS such  
14 as ultra high temperature (UHT) creamers or shelf-stable canned goods?
- 15 • What is the pH and  $a_w$  of the food in question using an independent  
16 laboratory and Association of Official Analytical Chemists (AOAC) methods  
17 of analysis?

18 A food designated as product assessment required (PA), in either table should be  
19 considered PHF/TCS Food until further study proves otherwise. The PA means that  
20 based on the food's pH and  $a_w$  and whether it was raw or heat-treated or packaged,  
21 it has to be considered PHF until inoculation studies or some other acceptable  
22 evidence shows that the food is a PHF/TCS food or not. The Food Code requires a  
23 variance request to the regulatory authority with the evidence that the food does not  
24 require time/temperature control for safety.

25 The Food Code definition designates certain raw plant foods as PHF/TCS food  
26 because they have been shown to support the growth of foodborne pathogens in  
27 the absence of temperature control and to lack intrinsic factors that would inhibit  
28 pathogen growth. Unless product assessment shows otherwise, these designations  
29 are supported by Tables A and B. For example:

1 For cut cantaloupe (pH 6.2-7.1,  $a_w > 0.99$ , not heat-treated), fresh sprouts (pH >  
2 6.5,  $a_w > 0.99$ , not heat-treated), and cut tomatoes (pH 4.23 - 5.04,  $a_w > 0.99$ , not  
3 heat-treated), Table B indicates that they are considered PHF/TCS foods unless a  
4 product assessment shows otherwise. Maintaining these products under the  
5 temperature control requirements prescribed in this code for PHF/TCS food will limit  
6 the growth of pathogens that may be present in or on the food and may help  
7 prevent foodborne illness.

8 If a facility adjusts the pH of a food using vinegar, lemon juice, or citric acid for  
9 purposes other than flavor enhancement, a variance is required under ¶ 3-  
10 502.11(C). A HACCP plan is required whether the food is a PHF/TCS food as in  
11 subparagraph 3-502.11(C)(1) or not a PHF/TCS food, as in subparagraph 3-  
12 502.11(C)(2). A standardized recipe validated by lab testing for pH and  $a_w$  would  
13 be an appropriate part of the variance request with annual (or other frequency as  
14 specified by the regulatory authority) samples tested to verify compliance with the  
15 conditions of the variance.

16 More information can be found in the Institute of Food Technologists (IFT) Report,  
17 [Evaluation and Definition of Potentially Hazardous Foods](#).

18 **Instructions for using the following Decision Tree and Table A and Table B:**

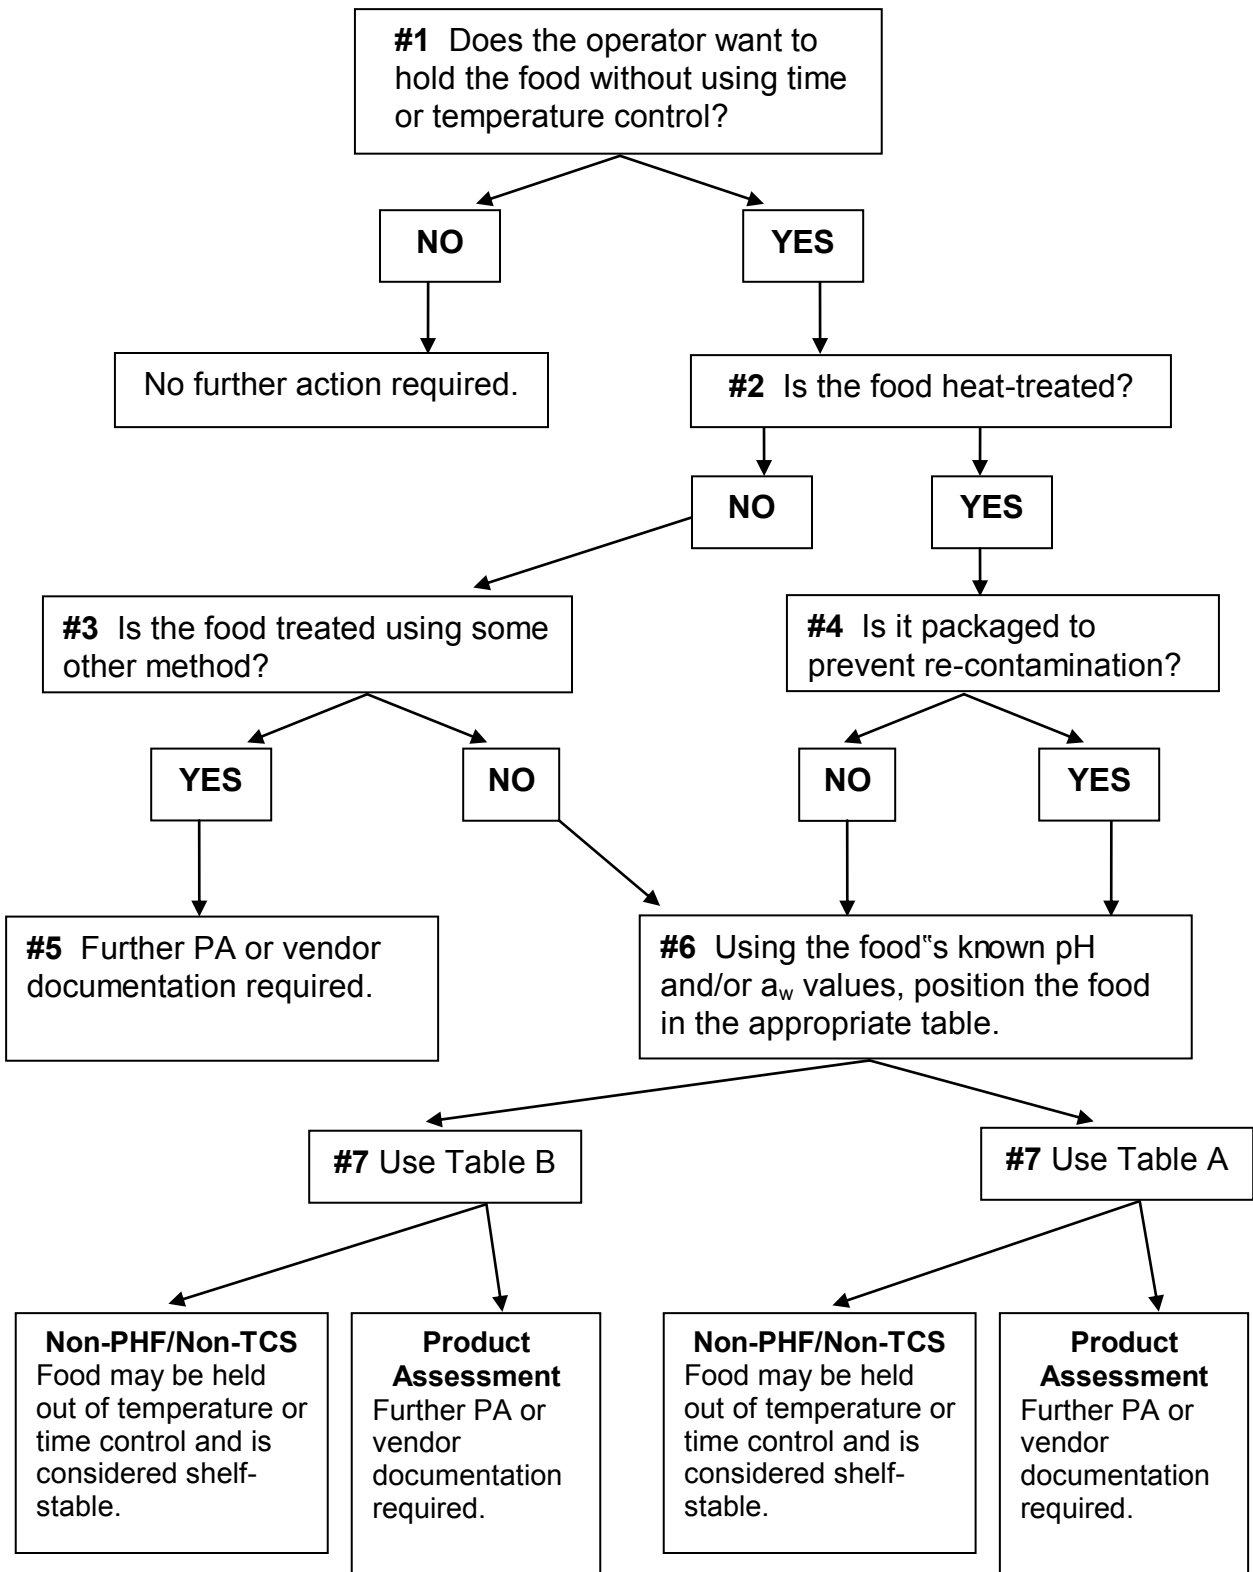

- 19 1. Does the operator want to hold the food without using time or temperature  
20 control?
  - 21 a. No – Continue holding the food at  $\leq 5^{\circ}\text{C}$  ( $41^{\circ}\text{F}$ ) or  $\geq 57^{\circ}\text{C}$  ( $135^{\circ}\text{F}$ ) for  
22 safety and/or quality.
  - 23 b. Yes – Continue using the decision tree to identify which table to use  
24 to determine whether time/temperature control for safety (TCS) is  
25 required.
- 26 2. Is the food heat-treated?
  - 27 a. No – The food is either raw, partially cooked (not cooked to the  
28 temperature specified in section 3-401.11 of the Food Code) or  
29 treated with some other method other than heat. Proceed to step #3.

- 1           b.     Yes – If the food is heat-treated to the required temperature for that  
2           food as specified under section 3-401.11 of the Food Code,  
3           vegetative cells will be destroyed although spores will survive.  
4           Proceed to step #4.
- 5         3.     Is the food treated using some other method?
- 6           a.     No –The food is raw or has only received a partial cook allowing  
7           vegetative cells and spores to survive. Proceed to step #6.
- 8           b.     Yes – If a method other than heat is used to destroy pathogens such  
9           as irradiation, high pressure processing, pulsed light, ultrasound,  
10          inductive heating, or ozonation, the effectiveness of the process  
11          needs to be validated by inoculation studies or other means. Proceed  
12          to step #5.
- 13        4.     Is it packaged to prevent re-contamination?
- 14          a.     No – Re-contamination of the product can occur after heat treatment  
15          because it is not packaged. Proceed to step #6.
- 16          b.     Yes – If the food is packaged immediately after heat treatment to  
17          prevent re-contamination, higher ranges of pH and/or  $a_w$  can be  
18          tolerated because spore-forming bacteria are the only microbial  
19          hazard. Proceed to step #7.
- 20        5.     Further product assessment or vendor documentation required.
- 21          a.     The vendor of this product may be able to supply documentation that  
22          inoculation studies indicate the food can be safely held without  
23          time/temperature control for safety.
- 24          b.     Food prepared or processed using new technologies may be held  
25          without time/temperature control provided the effectiveness of the use  
26          of such technologies is based on a validated inoculation study.
- 27        6.     Using the food’s known pH and/or  $a_w$  values, position the food in the  
28          appropriate table.
- 29          a.     Choose the column under “pH values” that contains the pH value of  
30          the food in question.

- 1           b.     Choose the row under “ $a_w$  values” that contains the  $a_w$  value of the  
2           food in question.
- 3           c.     Note where the row and column intersect to identify whether the food  
4           is “non-PHF/non-TCS food” and therefore does not require  
5           time/temperature control, or whether further product assessment (PA)  
6           is required. Other factors such as redox potential, competitive  
7           microorganisms, salt content, or processing methods may allow the  
8           product to be held without time/temperature control but an inoculation  
9           study is required.
- 10          7.     Use **Table A** for foods that are heat-treated and packaged **OR** use **Table B**  
11          for foods that are not heat-treated or heat-treated but not packaged.
- 12          8.     Determine if the item is non-PHF/non-TCS or needs further product  
13          assessment (PA).

## Chapter 2 Management and Personnel

### **Responsibility 2-101.11 Assignment.\***

Designation of a person in charge during all hours of operations ensures the continuous presence of someone who is responsible for monitoring and managing all food establishment operations and who is authorized to take actions to ensure that the Code's objectives are fulfilled. During the day-to-day operation of a food establishment, a person who is immediately available and knowledgeable in both operational and Code requirements is needed to respond to questions and concerns and to resolve problems.

In cases where a food establishment has several departments on the premises (e.g., a grocery store with deli, seafood, and produce departments) and the regulatory authority has permitted those departments individually as separate food establishments, it may be unnecessary from a food safety standpoint to staff each department with a separate Person in Charge during periods when food is not being prepared, packaged or served. While activities such as moving food products from a refrigerated display case to the walk-in refrigerator, cleaning the floors, or doing inventory when the department is not busy, do take place during these times, a designated Person in Charge for multiple departments or the entire facility can oversee these operations and be ready to take corrective actions if necessary.

### **Knowledge 2-102.11 Demonstration.\***

The designated person in charge who is knowledgeable about foodborne disease prevention, Hazard Analysis and Critical Control Point (HACCP) principles, and Code requirements is prepared to recognize conditions that may contribute to foodborne illness or that otherwise fail to comply with Code requirements, and to take appropriate preventive and corrective actions.

There are many ways in which the person in charge can demonstrate competency. Many aspects of the food operation itself will reflect the competency of that person. A dialogue with the person in charge during the inspection process will also reveal whether or not that person is enabled by a clear understanding of the Code and its

1 public health principles to follow sound food safety practices and to produce foods  
2 that are safe, wholesome, unadulterated, and accurately represented.

3 The Food Code does not require reporting of uninfected cuts or reporting of  
4 covered, protected infected cuts/lesions/boils since no bare hand contact with  
5 ready-to-eat (RTE) food is a Code requirement.

## 6 **2-102.20 Food Protection Manager Certification.**

7 Many food protection manager certification programs have shared a desire to have  
8 the food manager certificates they issue universally recognized and accepted by  
9 others – especially by the increasing number of regulatory authorities that require  
10 food manager certification.

11 Needed has been a mechanism for regulatory authorities to use in determining  
12 which certificates should be considered credible based on which certificate issuing  
13 programs meet sound organizational and certification procedures and use  
14 defensible processes in their test development and administration.

15 After a multi-year effort involving a diversity of stakeholder groups, the Conference  
16 for Food Protection (CFP) completed work on its ***Standards for Accreditation of***  
17 ***Food Protection Manager Certification Programs*** found at  
18 <http://www.foodprotect.org/pdf/standards.pdf>. In 2002 the Conference entered into  
19 a cooperative agreement with the American National Standards Institute (ANSI) to  
20 provide independent third-party evaluation and accreditation of certification bodies  
21 determined to be in conformance with these Conference standards. ANSI  
22 published its first listing of accredited certifiers in 2003.

23 The Acting Commissioner of the Food and Drug Administration, in his address  
24 before the 2004 biennial meeting of the Conference for Food Protection,  
25 commended this Conference achievement and encouraged universal acceptance  
26 based on the CFP/ANSI accreditation program.

27 Distributed at this meeting was the following letter addressed to the Conference  
28 Chair and signed by the Director of FDA's Center for Food Safety and Applied  
29 Nutrition. The letter puts forth the Agency's basis for its support of universal  
30 acceptance of food protection manager certifications.

1 “The 2004 biennial meeting of the **Conference for Food Protection** is a  
2 fitting occasion for FDA’s Center for Food Safety and Applied Nutrition to  
3 commend the Conference for its significant achievements in support of State  
4 and local food safety programs.

5 The FDA in a Memorandum of Understanding recognizes the Conference for  
6 Food Protection as a voluntary national organization qualified to develop  
7 standards to promote food protection. Conference recommendations  
8 contribute to improvements in the model FDA Food Code and help  
9 jurisdictions justify, adopt and implement its provisions.

10 Conference mechanisms involving active participation by representatives of  
11 diverse stakeholder groups produce consensus standards of the highest  
12 quality. An excellent example is the Conference’s **Standards for**  
13 **Accreditation of Food Protection Manager Certification Programs**, and  
14 its announcement of the new on-line listing of accredited certifiers of industry  
15 food protection managers. Many years in their development, these  
16 Conference standards identify the essential components necessary for a  
17 credible certification program. Components cover a wide range of  
18 requirements such as detailed criteria for exam development and  
19 administration, and responsibilities of the certification organization to  
20 candidates and the public.

21 FDA applauds the Conference for this significant achievement, and  
22 encourages agencies at all levels of government to accept certificates issued  
23 by listed certifiers as meeting their jurisdictions’ food safety knowledge and  
24 certification requirements. The American National Standards Institute  
25 (ANSI) has independently evaluated these certification programs under an  
26 agreement with the Conference for Food Protection. Governments and  
27 industry widely recognize and respect ANSI as an accrediting organization.  
28 ANSI has found certifiers it lists as accredited (<http://www.ansi.org/>) under  
29 “conformity assessment” – “personnel certification accreditation” to conform

1 to the Conference’s ***Standards for Accreditation of Food Protection***  
2 ***Manager Certification Programs***.\*

3 The Food Code states the person in charge of a food establishment is  
4 accountable for developing, carrying out, and enforcing procedures aimed at  
5 preventing food-borne illness. Section 2-102.11 states that one means by  
6 which a person in charge may demonstrate required knowledge of food  
7 safety is through certification as a food protection manager by passing an  
8 examination that is part of an accredited program.

9 FDA encourages food regulatory authorities and others evaluating  
10 credentials for food protection managers to recognize the Conference for  
11 Food Protection/ANSI means of accrediting certification programs. This  
12 procedure provides a means for universal acceptance of individuals who  
13 successfully demonstrate knowledge of food safety. The procedure provides  
14 officials assurance that food safety certification is based on valid, reliable,  
15 and legally defensible criteria. In addition, universal acceptance eliminates  
16 the inconvenience and unnecessary expense of repeating training and  
17 testing when managers work across jurisdictional boundaries.

18 FDA, along with State, local, tribal, and other Federal agencies and the food  
19 industry, share the responsibility for ensuring that our food supply is safe. It  
20 is anticipated that this new Conference for Food Protection/ANSI program  
21 will lead to enhanced consumer protection, improve the overall level of food  
22 safety, and be an important component of a seamless national food safety  
23 system.”

24 ***Duties***                      **2-103.11**              ***Person in Charge.***

25 A primary responsibility of the person in charge is to ensure compliance with Code  
26 requirements. Any individual present in areas of a food establishment where food  
27 and food-contact items are exposed presents a potential contamination risk. By

---

\*ANSI’s “***Directory of Accredited Personnel Certification Programs utilizing Conference for Food Protection (CFP) Standards***” may be viewed on-line by going to <http://www.ansi.org>. Select “Accreditation Services” in the menu on the left. Then select “ANSI Accredited Personnel Certification Bodies and Applicants” in the new left-hand menu under the heading “Personnel Certification Accreditation.”

1 controlling who is allowed in those areas and when visits are scheduled and by  
2 assuring that all authorized persons in the establishment, such as delivery,  
3 maintenance and service personnel, and pest control operators, comply with the  
4 Code requirements, the person in charge establishes an important barrier to food  
5 contamination.

6 Tours of food preparation areas serve educational and promotional purposes;  
7 however, the timing of such visits is critical to food safety. Tours may disrupt  
8 standard or routine operational procedures, and the disruption could lead to unsafe  
9 food. By scheduling tours during nonpeak hours the opportunities for contamination  
10 are reduced.

11 Paragraph (L) "EMPLOYEES are properly trained in FOOD safety as it relates to their  
12 assigned duties" allows industry to develop and implement operational-specific  
13 training programs for food employees. It is not intended to require that all food  
14 employees pass a test that is part of an accredited program.

## 15 **2-2 Employee Health**

### 16 **Overall goals**

17 The purpose of this section of the Food Code is to reduce the likelihood that certain  
18 viral and bacterial agents will be transmitted from infected food workers into food.  
19 The agents of concern are known to be readily transmissible via food that has been  
20 contaminated by ill food workers, and so for that reason, are the primary focus of  
21 the Employee Health section of the Food Code. However, there are different levels  
22 of risk associated with different levels of clinical illness. The structure of the  
23 restrictions and exclusions has, therefore, been designed in a tiered fashion  
24 depending on the clinical situation to offer the maximum protection to public health  
25 with the minimal disruption to employees and employers.

26 Four levels of illness or potential illness have been identified with the first level  
27 being the highest potential risk to public health and the fourth level being the  
28 lowest. The first level relates to employees who have specific symptoms (e.g.,  
29 vomiting, diarrhea, jaundice) while in the workplace. These symptoms are known to

1 be associated commonly with the agents most likely to be transmitted from infected  
2 food workers through contamination of food. The first level also relates to  
3 employees who have been diagnosed with typhoid fever or an infection with  
4 hepatitis A virus (within 14 days of symptoms). The second level relates to  
5 employees who have been diagnosed with the specific agents that are of concern,  
6 but who are not exhibiting symptoms of disease because their symptoms have  
7 resolved. The third level relates to employees who are diagnosed with the specific  
8 agents, but never develop any gastrointestinal symptoms. The fourth level relates  
9 to those individuals who are clinically well but who may have been exposed to a  
10 listed pathogen and are within the normal incubation period of disease.

11 The most significant degree of restriction and exclusion applies to the first level of  
12 food employee illness. Infected food employees in the first level are likely to be  
13 excreting high levels of their infectious pathogen, increasing the chance of  
14 transmission to food products, and thus on to those consuming the food. The first  
15 level includes food employees who are:

- 16 • Experiencing active symptoms of diarrhea or vomiting – with no  
17 diagnosis,
- 18 • Experiencing jaundice within the last 7 days-- with no diagnosis,
- 19 • Diagnosed with typhoid fever,
- 20 • Diagnosed with hepatitis A within 7 days of jaundice or 14 days of  
21 any symptoms, or
- 22 • Experiencing active symptoms of diarrhea or vomiting, and diagnosed  
23 with Norovirus, *E. coli* O157:H7 or other Enterohemorrhagic  
24 ***Escherichia coli*** (EHEC) or Shiga toxin-producing ***Escherichia coli***  
25 (STEC), or ***Shigella*** spp. infection.

26 Diagnosis with typhoid fever or hepatitis A virus is included in level 1 because  
27 employees diagnosed with these pathogens are likely to be shedding high levels of  
28 the pathogen in their stool without exhibiting gastrointestinal symptoms. Peak  
29 levels of hepatitis A viral shedding in the feces typically occurs before symptoms  
30 appear. Diarrhea and vomiting are reliable indicators of infection with Norovirus, ***E.***

1 **coli** O157:H7 or other EHEC, and **Shigella** spp., but are not typical symptoms of  
2 typhoid fever or hepatitis A. For example, employees diagnosed with typhoid fever  
3 are more likely to experience constipation, rather than diarrhea. Jaundice is also  
4 not always reliable as an indicator of a hepatitis A infection because employees  
5 can be infected with hepatitis A virus without experiencing jaundice (anicteric  
6 employees).

7 Maximum protection to public health requires excluding food employees  
8 suffering from typhoid fever, hepatitis A virus, or specific gastrointestinal symptoms  
9 associated with diseases identified as likely to be transmitted through contamination  
10 of food (See section 2-201.12, Tables 2-201.12 #1a and #1b in this Annex). This  
11 situation describes the highest level of risk in transmitting pathogens to food, or  
12 what we would find in the first level.

13 Food employees who have been diagnosed with one of the agents of concern, but  
14 are not symptomatic because their symptoms have resolved, are still likely to be  
15 carrying the infected agent in their intestinal tract. This makes such employees less  
16 likely to spread the agent into food than others who are actually symptomatic, but  
17 employees diagnosed with one of the agents of concern still pose an elevated  
18 threat to public health. For this reason, there are a series of exclusions (if the  
19 employees work in facilities serving highly susceptible populations (HSP)) and  
20 restrictions (for non-HSP facilities) depending on the agent involved (See section 2-  
21 201.12, Table #2). This situation describes the second level of risk in transmitting  
22 pathogens to food.

23 Diagnosed, asymptomatic food employees who never develop symptoms are  
24 typically identified during a foodborne illness outbreak investigation through  
25 microbiological testing. If infected and asymptomatic employees are not  
26 microbiologically tested, they will remain undetected and could therefore extend the  
27 duration of a foodborne illness outbreak through continued contamination of food.  
28 The Food Code provides restriction or exclusion guidelines for employees that are  
29 identified through microbiological testing with an infection from a listed foodborne  
30 pathogen, but are otherwise asymptomatic and clinically well (See section 2-201.12,

1 Table #3). The exclusion or restriction guidelines are applied until the identified  
2 food employees no longer present a risk for foodborne pathogen transmission. This  
3 situation describes the third level of risk in transmitting pathogens to food.  
4 Some food employees or conditional employees may report a possible exposure to  
5 an agent. For example, a food employee may have attended a function at which the  
6 food employee ate food that was associated with an outbreak of shigellosis, but the  
7 employee remains well. Such individuals fall into the category of having had a  
8 potential exposure and present a lower risk to public health than someone who is  
9 either symptomatic or who has a definitive diagnosis. They present a level of risk to  
10 public health that is greater than if they had not had the exposure. The approach  
11 taken in the Food Code to food employees who have had a potential exposure is  
12 based on the incubation times (time between exposure and the onset of symptoms)  
13 of the various agents. The times chosen for restriction are the upper end of the  
14 average incubation periods for the specific agents. The reasoning is that this will  
15 restrict food employees only up to the time when it is unlikely they will develop  
16 symptoms. As a further protection to public health, it is recommended that such  
17 exposed food employees pay particular attention to personal hygiene and report the  
18 onset of any symptoms (See section 2-201.12, Table #4). This situation describes  
19 the fourth level of risk in transmitting pathogens to food.  
20 This structured approach has linked the degree of exclusion and restriction to the  
21 degree of risk that an infected food worker will transmit an agent of concern into  
22 food. The approach strikes a balance between protecting public health and the  
23 needs of the food employee and employer.

1 The Food Code provisions related to employee health are aimed at removing highly  
2 infectious food employees from the work place. They were developed with  
3 recognition of the characteristics of the five important pathogens, and of the risk of  
4 disease transmission associated with symptomatic and asymptomatic shedders.  
5 The provisions also account for the increased risk associated with serving food to  
6 HSP's and the need to provide extra protection to those populations.

7 The Employee Health section was developed and revised with assistance and input  
8 from the Centers for Disease Control and Prevention (CDC) and the U.S. Equal  
9 Employment Opportunity Commission (EEOC). The exclusion and restriction  
10 criteria are based on communicable disease information, as required by the  
11 Americans with Disabilities Act of 1990, in the "[The List of Infectious and](#)  
12 [Communicable Diseases Which are Transmitted through the Food Supply](#)"  
13 published in the Federal Register on October 4, 2004, (Volume 69, Number 191) by  
14 the CDC, and from the Control of Communicable Diseases Manual, 18th Ed., David  
15 L. Heymann, MD, Editor, by the American Public Health Association, Washington  
16 D.C., 2004.

17 **2-201 Infected Food Employees and Conditional Employees**  
18 **Practical Applications of Using Subpart 2-201**

19 The information provided in Subpart 2-201 is designed to assist food establishment  
20 managers and regulatory officials in removing infected food employees when they  
21 are at greatest risk of transmitting foodborne pathogens to food. Practical  
22 applications of the information in Subpart 2-201 by a food establishment manager  
23 may involve using Subpart 2-201 as a basis for obtaining information on the health  
24 status of food employees and can also be used as a basis in developing and  
25 implementing an effective Employee Health Policy. Regulatory officials can benefit  
26 by using the information provided below as a basis for determining compliance with  
27 Subpart 2-201 during a facility food safety inspection.

28 The development and effective implementation of an employee health policy based  
29 on the provisions in Subpart 2-201 may help to prevent foodborne illness  
30 associated with contamination of food by ill or infected food employees. The person

1 in charge and food employees should be familiar with and able to provide the  
2 following information through direct dialogue or other means when interviewed by  
3 facility managers or regulatory officials. Compliance must be based, however, on  
4 first hand observations or information and cannot be based solely on responses  
5 from the person in charge to questions regarding hypothetical situations or  
6 knowledge of the Food Code. Also, when designing and implementing an  
7 employee health policy, the following information should be considered and  
8 addressed:

- 9 1. Does the establishment have an Employee Health Policy? If so, are  
10 the food employees aware of the employee health policy, and is it  
11 available in written format and readily available for food employees?  
12 (Note: A written Employee Health Policy is not a Food Code  
13 requirement unless the facility is operating under a pre-approved  
14 alternative procedure specified under ¶ 3-301.11(D)).
- 15 2. Does the establishment require conditional employees and food  
16 employees to report certain illnesses, conditions, symptoms, and  
17 exposures?
- 18 3. Are the reporting requirements explained to all employees?
- 19 4. What are the reporting requirements for conditional employees, food  
20 employees, and the food establishment manager?
- 21 5. Are conditional employees asked if they are experiencing certain  
22 symptoms or illnesses upon offer of employment? If so, which  
23 symptoms or illnesses?
- 24 6. If a food employee reports a diagnosis with one of the 5 listed  
25 pathogens in the Food Code, what questions are asked of the food  
26 employee? (The first question every food manager should ask a food  
27 employee who reports diagnosis with a listed pathogen is if the  
28 employee is currently having any symptoms.)
- 29 7. Who does the establishment notify when a food employee reports a  
30 diagnosis with one of the listed pathogens?

- 1           8.     What gastrointestinal symptoms would require exclusion of a food  
2           employee from the food establishment?  
3           9.     What history of exposure is a conditional employee or food employee  
4           required to report?  
5           10.    If a food employee reports a gastrointestinal symptom, what criteria  
6           are used to allow the employee to return to work?  
7

8           **Responsibilities   2-201.11     Responsibility of the Person in Charge,**  
9           **and Reporting                    Food Employees and Conditional Employees.\***  
10          **Symptoms and**  
11          **Diagnosis**

12          Proper management of a food establishment operation begins with employing  
13          healthy people and instituting a system of identifying employees who present a risk  
14          of transmitting foodborne pathogens to food or to other employees. The person in  
15          charge is responsible for ensuring all food employees and conditional employees  
16          are knowledgeable and understand their responsibility to report listed symptoms,  
17          diagnosis with an illness from a listed pathogen, or exposure to a listed pathogen to  
18          the person in charge. The person in charge is also responsible for reporting to the  
19          regulatory official if a food employee reports a diagnosis with a listed pathogen.  
20          This reporting requirement is an important component of any food safety program.  
21          A food employee who suffers from any of the illnesses or medical symptoms or has  
22          a history of exposure to a listed pathogen in this Code may transmit disease  
23          through the food being prepared. The person in charge must first be aware that a  
24          food employee or conditional employee is suffering from a disease or symptom  
25          listed in the Code before steps can be taken to reduce the chance of foodborne  
26          illness.

27          The person in charge may observe some of the symptoms that must be reported.  
28          However, food employees and conditional employees share a responsibility for  
29          preventing foodborne illness and are obligated to inform the person in charge if they  
30          are suffering from any of the listed symptoms, have a history of exposure to one of

1 the listed pathogens, or have been diagnosed with an illness caused by a listed  
2 pathogen. Food employees must comply with restrictions or exclusions imposed  
3 upon them.

4 A conditional employee is a potential food employee to whom a job offer has been  
5 made, conditional on responses to subsequent medical questions or examinations.

6 A conditional employee becomes a food employee as soon as the employee begins  
7 working, even if only on a restricted basis. When a conditional employee reports a  
8 listed diagnosis or symptom, the person in charge is responsible for ensuring that  
9 the conditional employee is prohibited from becoming a food employee until the  
10 criteria for reinstatement of an exclusion are met (as specified under section  
11 2-201.13 of the Food Code). When a symptomatic or diagnosed conditional  
12 employee has met the same criteria for reinstatement that apply to an excluded  
13 symptomatic or diagnosed food employee (as specified under section 2-201.13 of  
14 the Food Code), the conditional employee may then begin working as a food  
15 employee.

#### 16 **Reporting Symptoms:**

17 In order to protect the health of consumers and employees, information concerning  
18 the health status of conditional employees and food employees must be disclosed  
19 to the person in charge. The symptoms listed in the Code cover the common  
20 symptoms experienced by persons suffering from the pathogens identified by CDC  
21 as transmissible through food by infected food employees. A food employee  
22 suffering from any of the symptoms listed presents an increased risk of transmitting  
23 foodborne illness.

24 The symptoms of vomiting, diarrhea, or jaundice serve as an indication that an  
25 individual may be infected with a fecal-oral route pathogen, and is likely to be  
26 excreting high levels of the infectious agent. When a food employee is shedding  
27 extremely high numbers of a pathogen through the stool or vomitus, there is greater  
28 chance of transmitting the pathogen to food products.

29 Sore throat with fever serves as an indication that the individual may be infected  
30 with *Streptococcus pyogenes*. *Streptococcus pyogenes* causes a common infection

1 otherwise known as “streptococcal sore throat” or “strep throat.” Streptococcal sore  
2 throat can spread from contaminated hands to food, which has been the source of  
3 explosive streptococcal sore throat outbreaks. Previous foodborne episodes with  
4 streptococcus sore throat have occurred in contaminated milk and egg products.  
5 Food products can be contaminated by infected food workers hands or from nasal  
6 discharges. Untreated individuals in uncomplicated cases can be communicable for  
7 10-21 days, and untreated individuals with purulent discharges may be  
8 communicable for weeks or months.

9 Lesions containing pus that may occur on a food employee’s hands, as opposed to  
10 such wounds on other parts of the body, represent a direct threat for introducing  
11 ***Staphylococcus aureus*** into food. Consequently, a double barrier is required to  
12 cover hand and wrist lesions. Pustular lesions on the arms are less of a concern  
13 when usual food preparation practices are employed and, therefore, a single barrier  
14 is allowed. However, if the food preparation practices entail contact of the exposed  
15 portion of the arm with food, a barrier equivalent to that required for the hands and  
16 wrists would be necessitated. Lesions on other parts of the body need to be  
17 covered; but an impermeable bandage is not considered necessary for food safety  
18 purposes. Food employees should be aware that hands and fingers that contact  
19 pustular lesions on other parts of the body or with the mucous membrane of the  
20 nose also pose a direct threat for introducing ***Staphylococcus aureus*** into food.  
21 If a food employee has an infected cut and bandages it and puts on a glove, the  
22 employee does not have to report the infected cut to the person in charge.  
23 However, if the employee does not bandage it, reporting is required.

#### 24 **Title I of the Americans with Disabilities Act of 1990 (ADA)**

25 Title I of the Americans with Disabilities Act of 1990 (ADA) prohibits medical  
26 examinations and inquiries as to the existence, nature, or severity of a disability  
27 before extending a conditional offer of employment. In order for the permit holder  
28 and the person in charge to be in compliance with this particular aspect of the Code  
29 and the ADA, a conditional job offer must be made before making inquiries about  
30 the applicant’s health status.

1 The ADA also requires that employers provide reasonable accommodation to  
2 qualified applicants and employees with disabilities. A reasonable accommodation  
3 is a change in the application process, in the way a job is done, or to other parts of  
4 the job that enables a person with a disability to have equal employment  
5 opportunities. ADA disabilities are serious, long-term conditions. Most people with  
6 diseases resulting from the pathogens listed in the Food Code do not have ADA  
7 disabilities because these diseases are usually short-term in duration. In addition,  
8 the gastrointestinal symptoms listed in the Food Code usually are not long-term and  
9 severe enough, in themselves, to be ADA disabilities. Of course, these symptoms  
10 may be linked to other conditions that may be serious enough to be ADA  
11 disabilities, like Crohn's disease or cancer.

12 A food employer may exclude any employee under the Food Code upon initially  
13 learning that the employee has *Salmonella* Typhi, or has a gastrointestinal symptom  
14 listed in the Food Code. The excluded employee may then ask for an ADA  
15 reasonable accommodation instead of the exclusion. In response, the employer's  
16 first step should be to ask the employee to establish that the employee is disabled  
17 by the disease or symptom (or that the symptom is caused by another ADA  
18 disability). If the employee successfully proves that the employee has an ADA  
19 disability, then the employer may continue to exclude the employee under the Food  
20 Code if:

- 21 • there is no reasonable accommodation at work that would eliminate  
22 the risk of transmitting the disease while also allowing the employee  
23 to work in a food handling position, or
- 24 • all reasonable accommodations would pose an undue hardship on  
25 the employer's business; and
- 26 • there is no vacant position **not involving food handling** for which the  
27 employee is qualified and to which the employee can be reassigned.

28 Example 1: A food employee working in the café of a department store informs the  
29 employer that the employee has been diagnosed with a disease caused by  
30 *Salmonella* Typhi. The employer immediately excludes the employee under the

1 requirements of the Food Code. The employee then establishes that the disease is  
2 an ADA disability because it is severe and long-term and the employee requests  
3 reasonable accommodation instead of an exclusion. The employer determines that  
4 no reasonable accommodation would eliminate the risk of transmitting *Salmonella*  
5 Typhi through food and refuses to remove the exclusion. However, there is a  
6 vacant clerical position in another part of the store for which the employee is  
7 qualified. Unless the employer can establish that reassigning the employee to this  
8 position would be an undue hardship, the employer's failure to make the  
9 reassignment instead of continuing the exclusion would be a violation of the ADA.<sup>1</sup>

10 Example 2: A food employee has diarrhea and is excluded. The employee  
11 establishes that the diarrhea is caused by Crohn's disease. This employee also  
12 establishes a serious longstanding history of Crohn's disease and is an individual  
13 with an ADA disability. Crohn's disease is not a communicable disease and cannot  
14 be transmitted through food. No reasonable accommodation is needed to eliminate  
15 the risk of transmitting the disease through the food supply, so the Food Code  
16 exclusion should be removed. Of course, the Food Code's provisions on personal  
17 cleanliness for hands and arms apply as usual, requiring employees to clean hands  
18 and exposed portions of arms after using the toilet room and in other specified  
19 circumstances (Subpart 2-301).

20 Somewhat different rules apply to conditional employees. If a conditional employee  
21 reports a disease or symptom listed in the Food Code and shows that the disease  
22 or symptom makes the conditional employee an individual with an ADA disability,  
23 the employer may withdraw the job offer only if:

- 24 • The job involves food handling; and
- 25 • The employer determines that either there is no reasonable  
26 accommodation that would eliminate the risk of transmitting the  
27 disease through food, or any such accommodation would be an  
28 undue hardship to the business.

---

<sup>1</sup> Whether or not the employee in question is an individual with an ADA disability, in those jurisdictions where the Code is adopted, Food Code exclusions or restrictions must be removed when requirements for removal under § 2-201.13 of the Code are met.

- There is no need to offer the conditional employee a vacant position not involving food handling as a reasonable accommodation.

It should be noted that the information provided here about the ADA is intended to alert employers to the existence of ADA and related CFR requirements. For a comprehensive understanding of the ADA and its implications, consult the references listed in Annex 2 that relate to this section of the Code or contact the U.S. Equal Employment Opportunity Commission. See the Equal Employment Opportunity Commission's [How to Comply with the Americans with Disabilities Act: A Guide for Restaurants and Other Food Service Employers](http://www.eeoc.gov/facts/restaurant_guide.html), found at [http://www.eeoc.gov/facts/restaurant\\_guide.html](http://www.eeoc.gov/facts/restaurant_guide.html) or [http://www.eeoc.gov/facts/restaurant\\_guide\\_summary.html](http://www.eeoc.gov/facts/restaurant_guide_summary.html) for detailed information about the interaction between the FDA Food Code and the ADA.

The information required from applicants and food employees is designed to identify employees who may be suffering from a disease that can be transmitted through food. It is the responsibility of the permit holder to convey to applicants and employees the importance of notifying the person in charge of changes in their health status. Once notified, the person in charge can take action to prevent the likelihood of the transmission of foodborne illness. Applicants, to whom a conditional offer of employment is extended, and food employees are required to report their specific history of exposure, medical symptoms, and previous illnesses.

The symptoms listed may be indicative of a disease that is transmitted through the food supply by infected food employees.

As required by the ADA, the CDC published in the Federal Register on October 4, 2004, (Volume 69, Number 191) a list of infectious and communicable diseases that are transmitted through food. The CDC updates the list annually.

See "[List of Infectious and Communicable Diseases which are Transmitted through the Food Supply](http://a257.g.akamaitech.net/7/257/2422/06jun20041800/edocket.access.gpo.gov/2004/pdf/04-22260.pdf)" at

<http://a257.g.akamaitech.net/7/257/2422/06jun20041800/edocket.access.gpo.gov/2004/pdf/04-22260.pdf>). The list is divided into two parts: pathogens often transmitted and pathogens occasionally transmitted by infected persons who handle food.

The following Lists summarize the CDC list by comparing the common symptoms of each pathogen. Symptoms may include diarrhea, fever, vomiting, jaundice, and sore throat with fever. The CDC has no evidence that the HIV virus is transmissible via food. Therefore, a food employee positive for the HIV virus is not of concern unless suffering secondary illness listed below. The following Lists include all enterohemorrhagic or Shiga toxin-producing *E. coli* likely to occur in foods in the United States.

**LIST I. Pathogens Often Transmitted by Food Contaminated by Infected Persons Who Handle Food, and Modes of Transmission of Such Pathogens.**

8           **KEY: D = Diarrhea            V = Vomiting            S = Sore throat with fever**  
9                   **F = Fever                    J = Jaundice**

10           **The 5 Listed Pathogens:**

11           The CDC has designated the 5 organisms listed in the Food Code as having high  
12           infectivity via contamination of food by infected food employees. This designation is  
13           based on the number of confirmed cases reported that involved food employees  
14           infected with one of these organisms and/or the severity of the medical  
15           consequences to those who become ill.

16           The following is taken from information provided in the 18<sup>th</sup> Edition of Control of  
17           Communicable Diseases Manual, the CDC website, and the FDA Bad Bug Book,  
18           and is provided as background information on pathogen virulence, infectivity, and  
19           common symptoms exhibited with infection of each of the 5 listed pathogens.

20           **NOROVIRUS**

21           Noroviruses (genus Norovirus, family Caliciviridae) are a group of small (27-40nm),  
22           round structured, single-stranded RNA, nonenveloped viruses that cause acute  
23           gastroenteritis in humans. Norovirus has also been commonly known as “Norwalk-  
24           like virus,” “Small Round-structured Virus,” and “Winter Vomiting Disease.”

25           The CDC estimates that Norovirus is the leading cause of foodborne illness in the  
26           United States. Transmission of Norovirus has been shown to occur most commonly  
27           through the fecal oral route, with contaminated food identified as a common vehicle  
28           of transmission. Exclusion of food employees exhibiting or reporting diarrhea  
29           symptoms is an essential intervention in controlling the transmission of Norovirus

1 from infected food employees" hands to RTE food items. Norovirus also has a high  
2 secondary attack rate (> 50%) via person-to-person contact.

3 Norovirus has also been reported to cause infection by airborne transmission when  
4 individuals are in close physical proximity to an infected individual vomiting in the  
5 facility. Therefore, an infected individual vomiting in a food facility increases the  
6 risk of infecting employees and consumers. Foodborne illness outbreaks have  
7 occurred from consumers vomiting in the dining room, or employees vomiting on the  
8 premises. Removing food employees exhibiting or reporting vomiting symptoms  
9 from the food facility protects consumers and fellow workers from infection with  
10 Norovirus.

11 **Incubation Period:** Generally between 24 and 48 hours (median in outbreaks 33  
12 to 36 hours), but cases can occur within 12 hours of exposure.

13 **Symptoms and Complications:** Acute-onset explosive (or projectile) vomiting,  
14 watery non-bloody diarrhea with abdominal cramps, nausea, and occasionally, a  
15 low grade fever. Symptoms usually last 24 to 60 hours. Vomiting is more common  
16 in children. Recovery is usually complete and there is no evidence of any serious  
17 long-term sequelae. Among the young and the elderly, dehydration is a common  
18 complication. There is no long-term immunity to Norovirus and individuals may be  
19 repeatedly infected throughout their lifetimes. There is no specific therapy for viral  
20 gastroenteritis. Symptomatic therapy consists of replacement of fluid loss by the  
21 administration of liquids orally, and in rare instances, through parenteral  
22 intravenous fluid therapy. Earlier feeding studies conducted on Norovirus have  
23 found that as many as 30% of individuals infected with Norovirus are asymptomatic.

24 **Infectivity:** Noroviruses are highly contagious, and it is thought that an inoculum of  
25 as few as 10 viral particles may be sufficient to infect an individual. Although pre-  
26 symptomatic shedding may occur, shedding usually begins with onset of symptoms  
27 and may continue for 2 weeks after recovery. However, the degree of infectivity of  
28 prolonged shedding has not been determined. Norovirus is shed at high levels in  
29 the stool:  $10^5 - 10^7/g$  or more.

### 30 **SALMONELLA TYPHI**

1 *Salmonella enterica* subspecies *enterica* serovar Typhi (commonly S.Typhi) causes  
2 a systemic bacterial disease, with humans as the only host. This disease is  
3 relatively rare in the United States, with fewer than 500 sporadic cases occurring  
4 annually in the U.S. Worldwide, the annual estimated incidence of Typhoid fever is  
5 about 17 million cases with approximately 600,000 deaths. Currently, most cases of  
6 **S. Typhi** in industrialized nations are imported into the country from developing  
7 countries. Antibiotic-resistant strains have become prevalent in several areas of the  
8 world.

9 **Incubation period:** Depends on inoculum size and on host factors: from 3 days to  
10 over 60 days, with a usual range of 8 – 14 days.

11 **Symptoms:** Insidious onset of sustained fever, marked headache, malaise,  
12 anorexia, relative bradycardia, splenomegaly, and nonproductive cough in the early  
13 stage of the illness, rose spots on the trunk in 25% of white skinned patients and  
14 constipation more often than diarrhea in adults. The illness varies from mild illness  
15 with low-grade fever to severe clinical disease with abdominal discomfort and  
16 multiple complications.

17 **Infectivity:** The minimal infectious dose is estimated to be less than 1000 bacterial  
18 cells. An individual infected with **S. Typhi** is infectious as long as the bacilli appear  
19 in the excreta, usually from the first week throughout the convalescence; variable  
20 thereafter. About 10% of untreated typhoid fever patients will discharge bacilli for 3  
21 months after onset of symptoms, and 2%-5% become permanent carriers; fewer  
22 persons affected with paratyphoid organisms may become permanent gallbladder  
23 carriers.

#### 24 **ENTEROHEMORRHAGIC OR SHIGA TOXIN-PRODUCING ESCHERICHIA COLI**

25 **E. coli** O157:H7 is the most commonly identified strain of Enterohemorrhagic  
26 **Escherichia coli** (EHEC) or Shiga toxin-producing **Escherichia coli** (STEC) as a  
27 cause of foodborne illness in the United States. **E. coli** O157:H7 is a zoonotic  
28 disease derived from cattle and other ruminants. However, **E. coli** O157:H7 also  
29 readily transmits from person-to-person, so contaminated raw ingredients and ill  
30 food employees both can be sources of foodborne disease. Other EHEC or STEC

1 serotypes have been identified as a source of foodborne illness in the United  
2 States, however not as frequently as *E. coli* O157:H7. The other serogroups most  
3 commonly implicated as a cause of foodborne illness in the United States are O26,  
4 O111, O103, O45, and O121.

5 The Food Code definition of STEC covers all *E. coli* identified in clinical  
6 laboratories that produce Shiga toxins. Nearly 200 O:H combinations of *E. coli*  
7 have been shown to produce Shiga toxins. The Food Code definition includes all  
8 STEC, including those that have not been specifically implicated in human disease  
9 such as hemorrhagic colitis (i.e., bloody diarrhea) or hemolytic uremic syndrome  
10 (HUS). A subset of STEC that has the capacity to both produce Shiga toxin and  
11 cause “attaching and effacing” lesions in the intestine is classified as  
12 “enterohemorrhagic” (EHEC). EHEC *E. coli* cause hemorrhagic colitis, meaning  
13 bleeding enterically or bleeding from the intestine. Infections with EHEC may be  
14 asymptomatic but are classically associated with bloody diarrhea (hemorrhagic  
15 colitis) and hemolytic uremic syndrome (HUS) or thrombotic thrombocytopenic  
16 purpura (TTP). Virtually all human isolates of *E. coli* O157:H7 serotypes are  
17 EHEC.

18 **Incubation period:** From 2-10 days, with a median of 3-4 days.

19 **Symptoms:** The illness is characterized by severe cramping (abdominal pain) and  
20 diarrhea with a range from mild and nonbloody to stools that are virtually all blood.  
21 Occasionally vomiting occurs. Some individuals exhibit watery diarrhea only. Lack  
22 of fever in most patients can help to differentiate this infection from other enteric  
23 pathogens. About 8% of individuals with *E. coli* O157:H7 diarrhea progress to  
24 HUS. This rate varies for other serotypes of Enterohemorrhagic *E. coli*.

25 **Infectivity:** The infectious dose is for example *E. coli* O157:H7 can be as low as  
26 10 bacterial cells. Children under 5 years old are most frequently diagnosed with  
27 infection and are at greatest risk of developing HUS. The elderly also experience a  
28 greater risk of complications. The duration of excretion of Enterohemorrhagic *E.*  
29 *coli* in the stool is typically 1 week or less in adults, but can be up to 3 weeks in  
30 one-third of infected children.

## **SHIGELLA SPP.**

Causes an acute bacterial disease, known as shigellosis, and primarily occurs in humans, but also occurs in other primates such as monkeys and chimpanzees. An estimated 300,000 cases of shigellosis occur annually in the U.S. *Shigella* spp. consist of 4 species or serogroups, including *S. flexneri*, *S. boydii*, *S. sonnei*, and *S. dysenteriae*; which all differ in geographical distribution and pathogenicity. *Shigella* spp. are highly infectious and highly virulent. Outbreaks occur in overcrowding conditions, where personal hygiene is poor, including in institutions, such as prisons, mental hospitals, day care centers, and refugee camps, and also among men who have sex with men. Water and RTE foods contaminated by feces, frequently from food workers' hands, are common causes of disease transmission. Multidrug-resistant *Shigella* (including *S. dysenteriae* 1) have appeared worldwide. Concern over increasing antimicrobial resistance has led to reduced use of antimicrobial therapy in treating shigellosis.

**Incubation period:** Usually 1 – 3 days, but ranges from 12 to 96 hours, and up to 1 week for *S. dysenteriae* 1.

**Symptoms and Complications:** Abdominal pain, diarrhea, fever, nausea, and sometimes vomiting, tenesmus, toxemia, and cramps. The stools typically contain blood, pus, or mucus resulting from mucosal ulcerations. The illness is usually self-limited, with an average duration of 4-7 days. Infections are also associated with rectal bleeding, drastic dehydration, and convulsions in young children. The fatality rate for *Shigella dysenteriae* 1 may be as high as 20% among hospitalized cases. Other complications can also occur, such as Reiter's disease, reactive arthritis, intestinal perforation, and hemolytic uremic syndrome.

**Infectivity:** The infectious dose for humans is low, with as few as 10 bacterial cells depending on age and condition of the host. Infectivity occurs during acute infection and until the infectious agent is no longer present in feces, usually within 4 weeks after illness. Asymptomatic carriers may transmit infection; rarely, the carrier state may persist for months or longer.

## **HEPATITIS A VIRUS**

1 Hepatitis A virus (HAV) is a 27-nanometer picornavirus (positive strand RNA, non-  
2 enveloped virus). The hepatitis A virus has been classified as a member of the  
3 family *Picornaviridae*. The exact pathogenesis of HAV infection is not understood,  
4 but the virus appears to invade from the intestinal tract and is subsequently  
5 transported to the liver. The hepatocytes are the site of viral replication and the  
6 virus is thought to be shed via the bile.

7 HAV is most commonly spread by the fecal-oral route through person-to-person  
8 contact. Risk factors for reported cases of hepatitis A include personal or sexual  
9 contact with another case, illegal drug use, homosexual male sex contact, and  
10 travel to an endemic country. Common source outbreaks also can occur through  
11 ingestion of water or food that has fecal contamination. However, the source of  
12 infection is not identified for approximately 50% of reported cases.

13 HAV infection is endemic in developing countries, and less common in  
14 industrialized countries with good environmental sanitation and hygienic practices.  
15 In the developing world, nearly all HAV infections occur in childhood and are  
16 asymptomatic or cause a mild illness. As a result, hepatitis A (symptomatic  
17 infection with jaundice) is rarely seen in the developing world. More than 90% of  
18 adults born in many developing countries are seropositive.

19 Children play an important role in the transmission of HAV and serve as a source of  
20 infection for others, because most children have asymptomatic infections or mild,  
21 unrecognized HAV infections. In the United States, the disease is most common  
22 among school-aged children and young adults. After correction for under-reporting  
23 and undiagnosed infections, an estimated 61,000 HAV infections (includes cases of  
24 hepatitis A as well as asymptomatic infections) occurred in 2003.

25 **HAV Immunization:** Immune globulin can be used to provide passive pre-exposure  
26 immunoprophylaxis against hepatitis A. Protection is immediately conferred to an  
27 exposed individual following administration of IG, and immunity is provided for 3-5  
28 months following inoculation. IG is effective in preventing HAV infection when given  
29 as post-exposure immunoprophylaxis, if given within 14 days of exposure. When a  
30 food service worker with hepatitis A is identified, IG is often given to co-workers.

1 Active immunoprophylaxis using hepatitis A vaccine (a formalin-inactivated,  
2 attenuated strain of HAV) has been shown to provide immunity in > 95% of those  
3 immunized, with minimal adverse reactions. Hepatitis A vaccination of food workers  
4 has been advocated, but has not been shown to be cost-effective and generally is  
5 not recommended in the United States, although it may be appropriate in some  
6 communities.

7 **Incubation period:** Average 28 – 30 days (range 15 – 50 days).

8 **Symptoms and Complications:** Illness usually begins with symptoms such as  
9 nausea/vomiting, diarrhea, abdominal pain, fever, headache, and/or fatigue.  
10 Jaundice, dark urine or light colored stools might be present at onset, or follow  
11 illness symptoms within a few days. HAV infection of older children and adults is  
12 more likely to cause clinical illness with jaundice (i.e., hepatitis A); onset of illness is  
13 usually abrupt. In young adults, 76-97% have symptoms and 40-70% are  
14 jaundiced. Jaundice generally occurs 5-7 days after the onset of gastrointestinal  
15 symptoms. For asymptomatic infections, evidence of hepatitis may be detectable  
16 only through laboratory tests of liver infections such as alanine aminotransferase  
17 (ALT) tests. The disease varies in severity from a mild illness to a fulminant  
18 hepatitis, ranging from 1-2 weeks to several months in duration. In up to 10-15% of  
19 the reported cases, prolonged, relapsing hepatitis for up to 6 months occurs. The  
20 degree of severity often increases with age; however, most cases result in complete  
21 recovery, without sequelae or recurrence. The reported case fatality rate is 0.1% -  
22 0.3% and can reach 1.8% for adults over 50 years old.

23 **Diagnosis:** Diagnosis of HAV infection requires specific serological testing for IgM  
24 anti-HAV. IgM anti-HAV becomes undetectable within 6 months of illness onset  
25 for most persons; however, some persons can remain IgM anti-HAV positive for  
26 years after acute infection. Total anti-HAV (the only other licensed serologic test)  
27 can be detected during acute infection but remains positive after recovery and for  
28 the remainder of the person's life.

29 **Infectivity:** Evidence indicates maximum infectivity during the latter half of the  
30 incubation period, continuing for a few days after onset of jaundice. Most cases are

1 probably noninfectious after the first week of jaundice. Chronic shedding of HAV in  
2 feces has not been reported. HAV is shed at peak levels in the feces, one to two  
3 weeks before onset of symptoms, and shedding diminishes rapidly after liver  
4 dysfunction or symptoms appear. Liver dysfunction or symptoms occur at the same  
5 time circulating antibodies to HAV first appear. Immunity after infection probably  
6 lasts for life; immunity after vaccination is estimated to last for at least 20 years.

### 7 **Reporting History of Exposure:**

8 The reporting requirements for history of exposure are designed to identify  
9 employees who may be incubating an infection due to Norovirus, **Shigella** spp.,  
10 **E. coli** O157:H7 or other EHEC/STEC, typhoid fever, or HAV.

11 Which employees who report exposure are restricted?

- 12 • Employees who work in a food establishment serving a highly  
13 susceptible population (HSP) facility.

14 What constitutes exposure?

- 15 • Consuming a food that caused illness in another consumer due to  
16 infection with Norovirus, **Shigella** spp., **E. coli** O157:H7 or other  
17 EHEC/STEC, typhoid fever, or HAV.
- 18 • Attending an event or working in a setting where there is a known  
19 disease outbreak.
- 20 • Close contact with a household member who is ill and is diagnosed  
21 with a listed pathogen.

22 Why are other guidelines provided, in addition to restriction for employees serving  
23 an HSP who report exposure to hepatitis A virus?

- 24 • Employees who have had a hepatitis A illness in the past are most  
25 likely protected from infection by life-time immunity to hepatitis A  
26 infection.
- 27 • Immunity developed through immunization or IgG inoculation  
28 prevents hepatitis A infection in exposed employees.
- 29 • Our standard definition of HSP doesn't apply very well to HAV.  
30 Children under 6 years old who become infected with HAV are

1 generally asymptomatic, and while a higher proportion of susceptible  
2 elderly who become infected have serious illness, most  
3 institutionalized elderly are protected from HAV by prior infection.

4 What is the period of restriction?

- 5 • The period of restriction begins with the most recent time of  
6 foodborne or household member exposure and lasts for the usual  
7 incubation period of the pathogen as defined in the Control of  
8 Communicable Diseases Manual. This is the time that the employee  
9 is most likely to begin shedding the pathogen.
  - 10 ○ For Norovirus, 48 hours after the most recent exposure
  - 11 ○ For **Shigella** spp., 3 days after the most recent exposure
  - 12 ○ For **E. coli** O157:H7 or other EHEC/STEC, 3 days after the  
13 most recent exposure
  - 14 ○ For typhoid fever (**S. Typhi**), 14 days after the most recent  
15 exposure
  - 16 ○ For HAV, 30 days after the most recent exposure

17 What is the period of restriction when exposed to a diagnosed, ill household  
18 member?

- 19 • While the household member is symptomatic with an infection due to  
20 Norovirus, **Shigella** spp., **E coli** O157:H7 or other EHEC/STEC,  
21 typhoid fever (**S. Typhi**) or HAV;
- 22 • Plus during the usual incubation period of the pathogen of concern:
  - 23 ○ For Norovirus, symptomatic period plus 48 hours
  - 24 ○ For **Shigella** spp., symptomatic period plus 3 days
  - 25 ○ For **E. coli** O157:H7 or other EHEC/STEC, symptomatic period  
26 plus 3 days
  - 27 ○ For typhoid fever (**S. Typhi**), symptomatic period plus 14 days
  - 28 ○ For HAV, onset of jaundice plus 30 days

29 What is the appropriate response to a report of exposure to other food employees?

- 30 • Employees who report a history of exposure but who do not work in a HSP

1 facility should be reminded of the requirements for reporting illness,  
2 avoidance of bare hand contact with RTE foods, and proper hand washing  
3 and personal hygiene.

#### 4 **2-201.12 Exclusions and Restrictions.**<sup>2</sup>

5 Refer to public health reasons for § 2-201.11 for actions to take with conditional  
6 employees.

7 It is necessary to exclude food employees symptomatic with diarrhea, vomiting, or  
8 jaundice, or suffering from a disease likely to be transmitted through contamination  
9 of food, because of the increased risk that the food being prepared will be  
10 contaminated such as with a pathogenic microorganism. However, if the food  
11 employee is suffering from vomiting or diarrhea symptoms, and the condition is from  
12 a non-infectious condition, Crohn's disease or an illness during early stages of a  
13 pregnancy, the risk of transmitting a pathogenic microorganism is minimal. In this  
14 case, the food employee may remain working in a full capacity if they can  
15 substantiate that the symptom is from a noninfectious condition. The food  
16 employee can substantiate this through providing to the person in charge medical  
17 documentation or other documentation proving that the symptom is from a  
18 noninfectious condition.

19 Because of the high infectivity (ability to invade and multiply) and/or virulence  
20 (ability to produce severe disease), of typhoid fever (***Salmonella Typhi***) and  
21 hepatitis A virus, a food employee diagnosed with an active case of illness caused  
22 by either of these two pathogens, whether asymptomatic or symptomatic, must be  
23 excluded from food establishments. The exclusion is based on the high infectivity,  
24 and/or the severe medical consequences to individuals infected with these  
25 organisms. A food employee diagnosed with an active case of illness caused by  
26 Norovirus, ***Shigella*** spp., or ***E. coli*** O157:H7 or other EHEC/STEC, is excluded if

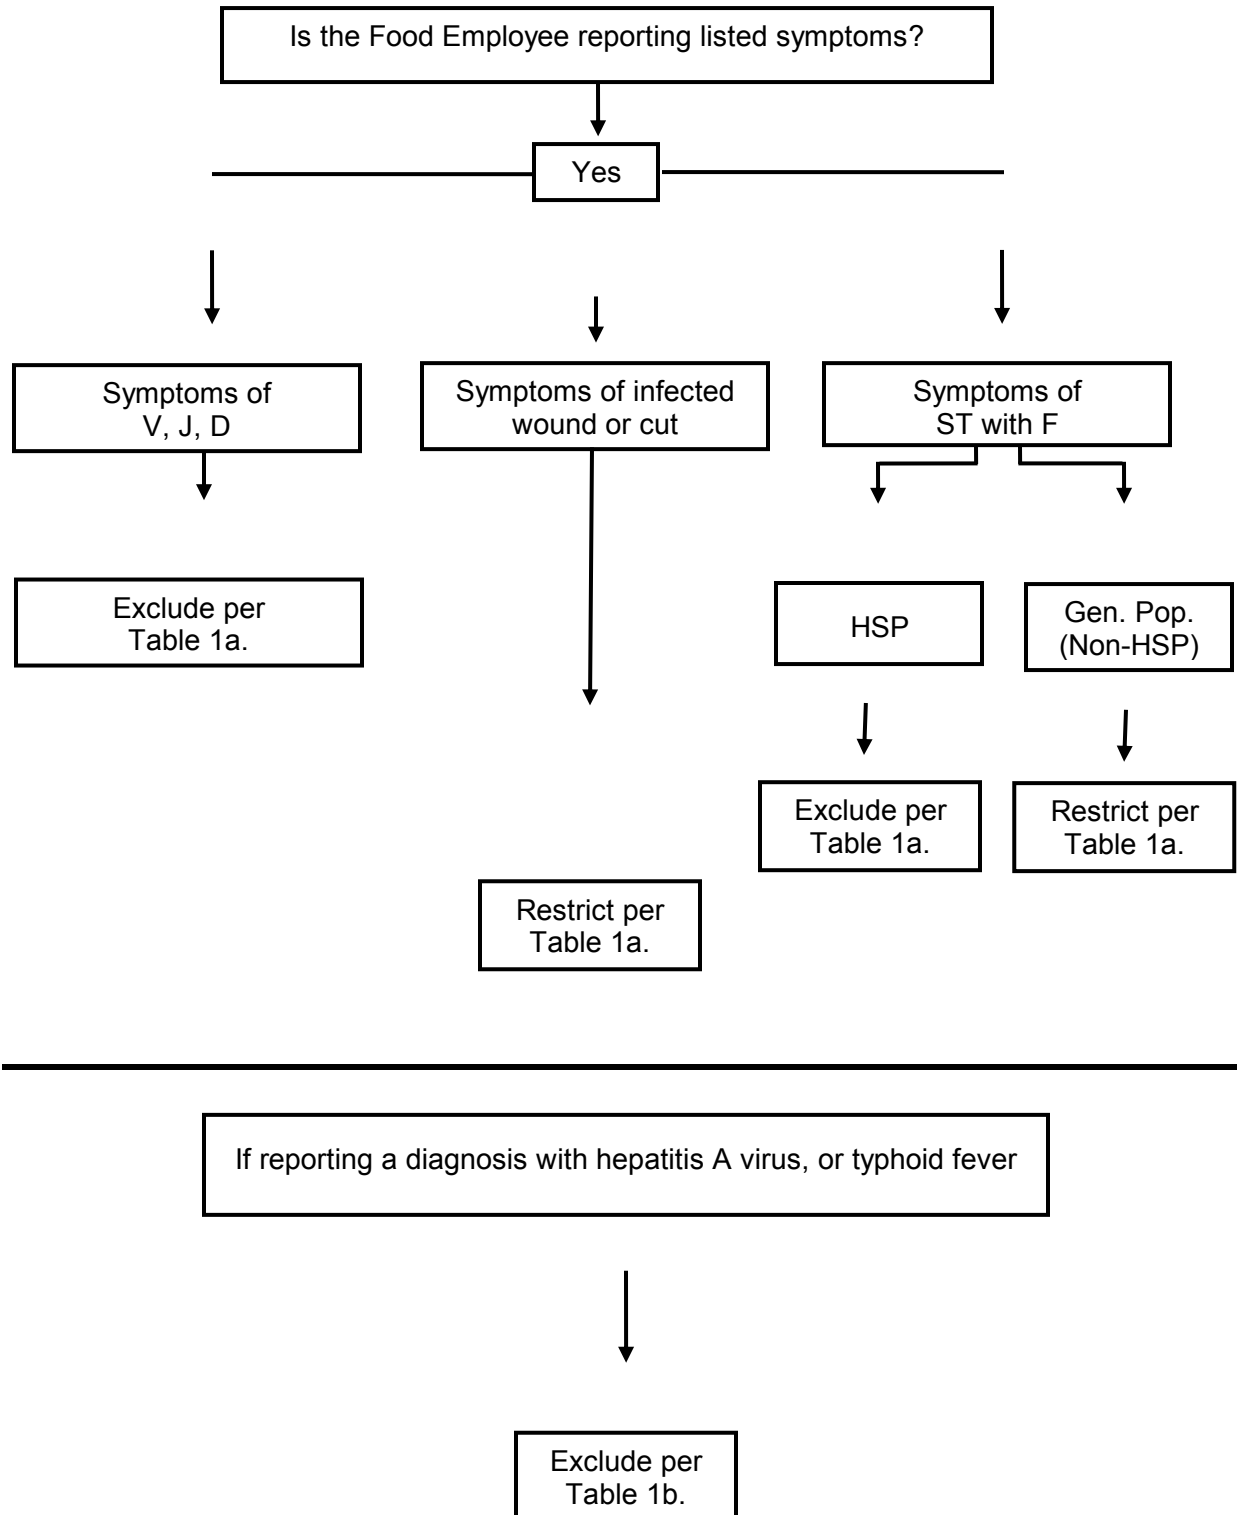

---

<sup>2</sup>In order to comply with Title I of the Americans with Disabilities Act, an exclusion must also be removed if the employee is entitled to a reasonable accommodation that would eliminate the risk of transmitting the disease. Reasonable accommodation may include reassignment to another position in which the individual would not work around food. The steps an employer must take when an excluded employee requests reasonable accommodation are briefly described in Annex 3, § 2-201.11. However, it is not possible to explain all relevant aspects of the ADA within this Annex. When faced with an apparent conflict between ADA and the Food Code's exclusion and restriction requirements, employers should contact the U.S. Equal Employment Opportunity Commission.

1 exhibiting symptoms of vomiting and diarrhea, and then allowed to work as the level  
2 of risk of pathogen transmission decreases (See section 2-201.12, Tables #1b, #2  
3 and #3).

4 The degree of risk for a food employee or conditional employee who is diagnosed  
5 with an infection but asymptomatic with regard to symptoms, to transmit a foodborne  
6 pathogen decreases with the resolution of symptoms. This risk decreases even  
7 further for those employees that are diagnosed with a listed pathogen, but never  
8 developed symptoms. The decrease in risk is taken under consideration when  
9 excluding and restricting diagnosed food employees and results in a slight  
10 difference in the way food employees diagnosed with Norovirus, but asymptomatic  
11 with respect to gastrointestinal symptoms are handled (See section 2-201.12, Table  
12 #2).

1                                   **2-201.12    Exclusion and Restrictions (continued)<sup>3</sup>**

2           Restrictions and exclusions vary according to the population served because highly  
3           susceptible populations have increased vulnerability to foodborne illness. For  
4           example, foodborne illness in a healthy individual may be manifested by mild flu-like  
5           symptoms. The same foodborne illness may have serious medical consequences  
6           in immunocompromised individuals. This point is reinforced by statistics pertaining  
7           to deaths associated with foodborne illness caused by **Salmonella Enteritidis**.  
8           Over 70% of the deaths in outbreaks attributed to this organism occurred among  
9           individuals who for one reason or another were immunocompromised. This is why  
10          the restrictions and exclusions listed in the Code are especially stringent for food  
11          employees serving highly susceptible populations.

12          Periodic testing of food employees for the presence of diseases transmissible  
13          through food is not cost effective or reliable. Therefore, restriction and exclusion  
14          provisions are triggered by the active gastrointestinal symptoms, followed by  
15          diagnosis and history of exposure.

16          The history of exposure that must be reported applies only to the 5 organisms  
17          listed. Upon being notified of the history of exposure, the person in charge should  
18          immediately:

- 19          1.       Discuss the traditional modes of transmission of fecal-oral route pathogens.
- 20          2.       Advise the food employee to observe good hygienic practices both at home  
21                  and at work. This includes a discussion of proper handwashing, as  
22                  described in the Code, after going to the bathroom, changing diapers, or  
23                  handling stool-soiled material.
- 24          3.       Review the symptoms listed in the Code that require immediate exclusion  
25                  from the food establishment.

---

<sup>3</sup>In order to comply with Title I of the Americans with Disabilities Act, an exclusion must also be removed if the employee is entitled to a reasonable accommodation that would eliminate the risk of transmitting the disease. Reasonable accommodation may include reassignment to another position in which the individual would not work around food. The steps an employer must take when an excluded employee requests reasonable accommodation are briefly described in Annex 3, § 2-201.11. However, it is not possible to explain all relevant aspects of the ADA within this Annex. When faced with an apparent conflict between the ADA and the Food Code's exclusion and restriction requirements, employers should contact the U.S. Equal Employment Opportunity Commission.

1 4. Remind food employees of their responsibility as specified in the Code to  
2 inform the person in charge immediately upon the onset of any of the  
3 symptoms listed in the Code.

4 5. Ensure that the food employee stops work immediately if any of the  
5 symptoms described in the Code develop and reports to the person in  
6 charge.

7 A restricted food employee may work in an area of the food establishment that  
8 houses packaged food, wrapped single-service or single-use articles, or soiled food  
9 equipment or utensils. Examples of activities that a restricted person might do  
10 include working at the cash register, seating patrons, bussing tables, stocking  
11 canned or other packaged foods, or working in a non-food cleaning or maintenance  
12 capacity consistent with the criteria in the definition of the term “restricted.” A food  
13 employee who is restricted from working in one food establishment may not work in  
14 an unrestricted capacity in another food establishment, but could work unrestricted  
15 in another retail store that is not a food establishment. A restricted food employee  
16 may enter a food establishment as a consumer.

17 An excluded individual may not work as a food employee on the premises of any  
18 food establishment.

### 19 **2-201.13 Removal of Exclusions and Restrictions.<sup>4</sup>**

20 Food employees diagnosed with Norovirus, hepatitis A virus, *Shigella* spp., *E. coli*  
21 O157:H7 or other EHEC, and symptomatic with diarrhea, vomiting, or jaundice, are  
22 excluded under subparagraph 2-201.12 (A)(2) or 2-201.12(B)(2). However, these  
23 symptomatic, diagnosed food employees differ from symptomatic, undiagnosed food  
24 employees in the requirements that must be met before returning to work in a full  
25 capacity after symptoms resolve.

---

<sup>4</sup>In order to comply with Title I of the Americans with Disabilities Act, an exclusion must also be removed if the employee is entitled to a reasonable accommodation that would eliminate the risk of transmitting the disease. Reasonable accommodation may include reassignment to another position in which the individual would not work around food. The steps an employer must take when an excluded employee requests reasonable accommodation are briefly described in Annex 3, § 2-201.11. However, it is not possible to explain all relevant aspects of the ADA within this Annex. When faced with an apparent conflict between the ADA and the Food Code’s exclusion and restriction requirements, employers should contact the U.S. Equal Employment Opportunity Commission.

1 The person in charge may allow undiagnosed food employees who are initially  
2 symptomatic and whose symptoms have resolved to return to work in a full capacity  
3 24 hours after symptoms resolve.

4 However, diagnosis with a listed pathogen invokes additional requirements before  
5 the person in charge may allow diagnosed food employees to return to work in full  
6 capacity.

7 Asymptomatic food employees diagnosed with Norovirus, *Shigella* spp., *E. coli*  
8 O157:H7 or other EHEC may not return to work in a full capacity for at least 24  
9 hours after symptoms resolve. The person in charge shall only allow these food  
10 employees to work on a restricted basis 24 hours after symptoms resolve and they  
11 shall only allow this if not in a food establishment that serves a highly susceptible  
12 population. These restricted food employees remain restricted until they are  
13 medically cleared or otherwise meet the criteria for removal from restriction as  
14 specified under subparagraphs 2-201.13(D) (1)-(2); 2-201.13(E)(1)-(2); or 2-  
15 201.13(F)(1)-(2).

16 In a food establishment that serves a highly susceptible population, food employees  
17 who are diagnosed with Norovirus, *Shigella* spp., *E. coli* O157:H7 or other EHEC  
18 and initially symptomatic with vomiting or diarrhea, shall not work on a restricted  
19 basis after being asymptomatic for at least 24 hours. These food employees must  
20 remain excluded until they are medically cleared or otherwise meet the criteria for  
21 removal from exclusion from a highly susceptible population under subparagraph 2-  
22 201.13(D) (1)-(2), 2-201.13(E)(1)-(2), or 2-201.13 (F)(1)-(2).

23 Food employees diagnosed with **hepatitis A virus** are always excluded if  
24 diagnosed within 14 days of exhibiting any illness symptom, until at least 7 days  
25 after the onset of jaundice, or until medically cleared as specified under  
26 subparagraphs 2-201.13(B)(1)-(4).

27 Food employees diagnosed with **hepatitis A virus** are always excluded if  
28 diagnosed within 14 days of exhibiting any illness symptom, until at least 7 days  
29 after the onset of jaundice, or until medically cleared as specified under  
30 subparagraph 2-201.13(B)(1)-(3). A food employee with an anicteric infection with

1 the hepatitis A virus has a mild form of hepatitis A without jaundice. Food  
2 employees diagnosed with an anicteric infection with the hepatitis A virus are  
3 excluded if they are within 14 days of any symptoms. Anicteric, diagnosed food  
4 employees shall be removed from exclusion if more than 14 days have passed  
5 since they became symptomatic, or if medically cleared. Asymptomatic food  
6 employees diagnosed with an active infection with the hepatitis A virus are also  
7 excluded until medically cleared.

8 ***Hands and Arms***            **2-301.11**        **Clean Condition.\***

9 The hands are particularly important in transmitting foodborne pathogens. Food  
10 employees with dirty hands and/or fingernails may contaminate the food being  
11 prepared. Therefore, any activity which may contaminate the hands must be  
12 followed by thorough handwashing in accordance with the procedures outlined in  
13 the Code.

14 Even seemingly healthy employees may serve as reservoirs for pathogenic  
15 microorganisms that are transmissible through food. Staphylococci, for example,  
16 can be found on the skin and in the mouth, throat, and nose of many employees.  
17 The hands of employees can be contaminated by touching their nose or other  
18 body parts.

19                                    **2-301.12**            **Cleaning Procedure.\***

20 Handwashing is a critical factor in reducing fecal-oral pathogens that can be  
21 transmitted from hands to RTE food as well as other pathogens that can be  
22 transmitted from environmental sources. Many employees fail to wash their hands  
23 as often as necessary and even those who do may use flawed techniques.

24 In the case of a food worker with one hand or a hand-like prosthesis, the Equal  
25 Employment Opportunity Commission has agreed that this requirement for thorough  
26 handwashing can be met through reasonable accommodation in accordance with  
27 the Americans with Disabilities Act. Devices are available which can be attached to  
28 a lavatory to enable the food worker with one hand to adequately generate the  
29 necessary friction to achieve the intent of this requirement.

1 The greatest concentration of microbes exists around and under the fingernails of  
2 the hands. The area under the fingernails, known as the “subungal space,” has by  
3 far the largest concentration of microbes on the hand and this is also the most  
4 difficult area of the hand to decontaminate. Fingernail brushes, if used properly,  
5 have been found to be effective tools in decontaminating this area of the hand.  
6 Proper use of single-use fingernail brushes, or designated individual fingernail  
7 brushes for each employee, during the handwashing procedure can achieve up to a  
8 5-log reduction in microorganisms on the hands.

9 There are two different types of microbes on the hands, transient and resident  
10 microbes. Transient microbes consist of contaminating pathogens which are  
11 loosely attached to the skin surface and do not survive or multiply. A moderate  
12 number of these organisms can be removed with adequate handwashing. Resident  
13 microbes consist of a relatively stable population that survive and multiply on the  
14 skin and they are not easily washed off the hands. Resident microbes on the  
15 hands are usually not a concern for potential contamination in food service.

16 All aspects of proper handwashing are important in reducing microbial transients  
17 on the hands. However, friction and water have been found to play the most  
18 important role. This is why the amount of time spent scrubbing the hands is critical  
19 in proper handwashing. It takes more than just the use of soap and running water  
20 to remove the transient pathogens that may be present. It is the abrasive action  
21 obtained by vigorously rubbing the surfaces being cleaned that loosens the  
22 transient microorganisms on the hands.

23 Research has shown a minimum 10-15 second scrub is necessary to remove  
24 transient pathogens from the hands and when an antimicrobial soap is used, a  
25 minimum of 15 seconds is required. Soap is important for the surfactant effect in  
26 removing soil from the hands and a warm water temperature is important in  
27 achieving the maximum surfactant effect of the soap.

28 Every stage in handwashing is equally important and has an additive effect in  
29 transient microbial reduction. Therefore, effective handwashing must include  
30 scrubbing, rinsing, and drying the hands. When done properly, each stage of

1 handwashing further decreases the transient microbial load on the hands. It is  
2 equally important to avoid recontaminating hands by avoiding direct hand contact  
3 with heavily contaminated environmental sources, such as manually operated  
4 handwashing sink faucets, paper towel dispensers, and rest room door handles  
5 after the handwashing procedure. This can be accomplished by obtaining a paper  
6 towel from its dispenser before the handwashing procedure, then, after  
7 handwashing, using the paper towel to operate the hand sink faucet handles and  
8 restroom door handles.

9 Handwashing done properly can result in a 2-3 log reduction in transient bacteria  
10 and a 2-log reduction in transient viruses and protozoa. With heavy contamination  
11 of transient microbial pathogens, (i.e.,  $> 10^4$  microbes, as found on hands  
12 contaminated with bodily wastes and infected bodily fluids) handwashing may be  
13 ineffective in completely decontaminating the hands. Therefore, a further  
14 intervention such as a barrier between hands and ready-to-eat food is necessary.

#### 15 **2-301.13 Special Handwash Procedures.\***

16 This section is reserved.

17 In earlier editions of the Code, FDA's model contained a provision for a Special  
18 Procedure in certain situations. Pursuant to a 1996 Conference for Food Protection  
19 (CFP) Recommendation, the text of this Code provision is removed and the section  
20 is reserved. It is FDA's intent to further research the matter and to submit the  
21 findings to the CFP for reconsideration of the matter.

#### 22 **2-301.14 When to Wash.\***

23 The hands may become contaminated when the food employee engages in specific  
24 activities. The increased risk of contamination requires handwashing immediately  
25 after the activities listed. The specific examples listed in this Code section are not  
26 intended to be all inclusive. Employees must wash their hands after any activity  
27 which may result in contamination of the hands.

#### 28 **2-301.15 Where to Wash.**

29 Effective handwashing is essential for minimizing the likelihood of the hands  
30 becoming a vehicle of cross contamination. It is important that handwashing be

1 done only at a properly equipped handwashing facility in order to help ensure that  
2 food employees effectively clean their hands. Handwashing sinks are to be  
3 conveniently located, always accessible for handwashing, maintained so they  
4 provide proper water temperatures and pressure, and equipped with suitable hand  
5 cleansers, nail brushes, and disposable towels and waste containers, or hand  
6 dryers. It is inappropriate to wash hands in a food preparation sink since this may  
7 result in avoidable contamination of the sink and the food prepared therein.  
8 Service sinks may not be used for food employee handwashing since this practice  
9 may introduce additional hand contaminants because these sinks may be used for  
10 the disposal of mop water, toxic chemicals, and a variety of other liquid wastes.  
11 Such wastes may contain pathogens from cleaning the floors of food preparation  
12 areas and toilet rooms and discharges from ill persons.

### 13 **2-301.16 Hand Antiseptics.**

14 In the 2005 Food Code, the use of the term “hand sanitizer” was replaced by the  
15 term “hand antiseptic” to eliminate confusion with the term “sanitizer,” a defined  
16 term in the Food Code, and to more closely reflect the terminology used in the FDA  
17 Tentative Final Monograph for Health-Care Antiseptic Drug Products for OTC  
18 Human Use, Federal Register: June 17, 1994.

19 The term “sanitizer” is typically used to describe control of bacterial contamination  
20 of inert objects or articles, or equipment and utensils, and other cleaned food-  
21 contact surfaces. The Food Code definition of “sanitizer” requires a minimum  
22 microbial reduction of 5 logs, which is equal to a 99.999% reduction. The FDA  
23 bases the 5-log reduction on the AOAC International’s “Official Methods of Analysis  
24 2003,” which requires a minimum 5-log reduction in microorganisms to achieve  
25 “sanitization.”

26 Sanitizers used to disinfect food-contact equipment and utensils can easily achieve  
27 the 5-log reduction of microorganisms and often far exceed this minimum  
28 requirement. However, removing microorganisms from human skin is a totally  
29 different process and sterilization of human skin is nearly impossible to achieve  
30 without damaging the skin. Many antimicrobial hand agents typically achieve a

1 much smaller reduction in microorganisms than the 5-log reduction required for  
2 “sanitization.” Therefore, the effect achieved from using antimicrobial hand  
3 agents is not consistent with the definition of “sanitization” in the Food Code.

4 The word “antiseptic” is a Greek term, meaning “against putrefaction,” and  
5 eventually evolved into a second definition, meaning, “a substance used to destroy  
6 pathogenic microorganisms.” The term “antiseptic” is often used to describe agents  
7 used on skin to prevent infection of the skin.

8 “Antiseptic” is defined under section 201 (o) of the Federal Food, Drug, and  
9 Cosmetic Act (the act) (21 U.S.C. 321 (o)), as: “The representation of a drug, in its  
10 labeling, as an antiseptic shall be considered to be a representation of a germicide,  
11 except in the case of a drug purporting to be, or represented as, an antiseptic for  
12 inhibitory use as a wet dressing, ointment, dusting powder, or such other use as  
13 involves prolonged contact with the body.”

14 Section 333.403 of the FDA Tentative Final Monograph for Health-Care Antiseptic  
15 Drug Products for OTC Human Use, Federal Register: June 17, 1994, defines a  
16 “health-care antiseptic” as an antiseptic-containing drug product applied topically to  
17 the skin to help prevent infection or to help prevent cross contamination. An  
18 “antiseptic handwash” or “health-care personnel handwash drug product” is  
19 defined in Section 333.403 of the Monograph as an antiseptic containing  
20 preparation designed for frequent use; it reduces the number of transient  
21 microorganisms on intact skin to an initial baseline level after adequate washing,  
22 rinsing, and drying; it is a broad spectrum, and persistent antiseptic containing  
23 preparation that significantly reduces the number of microorganisms on intact skin.  
24 Replacing the term “hand sanitizer” with the term “hand antiseptic” allows the use of  
25 a more scientifically appropriate term that is used to describe reduction of  
26 microorganisms on the skin and will improve clarification and regulation of these  
27 products.

28 The provisions of § 2-301.16 are intended to ensure that an antimicrobial  
29 product applied to the hands is 1) safe and effective when applied to human skin,  
30 and 2) a safe food additive when applied to bare hands that will come into direct

1 contact with food. Because of the need to protect workers and to ensure safe food,  
2 hand antiseptics must comply with both the human drug and the food safety  
3 provisions of the law. The prohibition against bare hand contact contained in 3-  
4 301.11(B) applies only to an exposed ready-to-eat food.

5 As a Drug Product

6 There are two means by which a hand antiseptic is considered to be safe and  
7 effective when applied to human skin:

8 1. A hand antiseptic may be approved by FDA under a new drug application  
9 based on data showing safety and effectiveness and may be listed in the  
10 publication *Approved Drug Products with Therapeutic Equivalence*  
11 *Evaluations*. This document is maintained by the Food and Drug  
12 Administration, Center for Drug Evaluation and Research, Office of  
13 Pharmaceutical Science, Office of Generic Drugs. Also known as the  
14 “Orange Book,” this document provides “product-specific” listings rather than  
15 listings by compound. It is published annually with monthly supplements and  
16 is available at <http://www.fda.gov/cder/ob/default.htm>. However, as of the  
17 end of 1998, no hand antiseptics are listed in this publication since no new  
18 drug applications have been submitted and approved for these products.

19 2. A hand antiseptic active ingredient may be identified by FDA in the  
20 monograph for OTC (over-the-counter) Health-Care Antiseptic Drug Products  
21 under the antiseptic handwash category. Since hand anti septic products  
22 are intended and labeled for topical antimicrobial use by food employees in  
23 the prevention of disease in humans, these products are “drugs” under the  
24 Federal Food, Drug, and Cosmetic Act § 201(g). As drugs, hand antiseptics  
25 and dips must be manufactured by an establishment that is duly registered  
26 with the FDA as a drug manufacturer; their manufacturing, processing,  
27 packaging, and labeling must be performed in conformance with drug Good  
28 Manufacturing Practices (GMP's); and the product must be listed with FDA  
29 as a drug product.

1 Products having the same formulation, labeling, and dosage form as those that  
2 existed in the marketplace on or before December 4, 1975, for hand antiseptic use  
3 by food handlers, are being evaluated under the Over-the-Counter (OTC) Drug  
4 Review by FDA's Center for Drug Evaluation and Research. However, as of May  
5 2005, a final OTC drug monograph for these products has not been finalized.  
6 Therefore, FDA has not made a final determination that any of these products are  
7 generally recognized as safe and effective (GRAS/E).

8 GRAS/E antimicrobial ingredients for hand sanitizer use by food handlers will be  
9 identified in a future final monograph issued under the OTC Drug Review.  
10 Information about whether a specific product is covered by the proposed  
11 monograph may be obtained from the tentative final monograph (TFM) for "Health  
12 Care Antiseptic Drug Products for OTC Human Use; Proposed Rule." This TFM,  
13 which was published in the ***Federal Register*** of June 17, 1994 (59 FR 31402),  
14 describes the inclusion of hand sanitizers in this Review on page 31440 under  
15 Comment 28 of Part II. Information about whether a specific product is included in  
16 this proposed monograph may also be available from the manufacturer.

17 Questions regarding acceptability of a hand antiseptic with respect to OTC  
18 compliance may be directed to the Division of New Drugs and Labeling Compliance  
19 (HFD-310), Office of Compliance, Center for Drug Evaluation and Research, Food  
20 and Drug Administration, 11919 Rockville Pike, Rockville, MD 20852. Specific  
21 product label/promotional information and the formulation are required for  
22 determining a product's regulatory status.

### 23 As a Food Additive

24 To be subject to regulation under the food additive provisions of the Federal Food,  
25 Drug, and Cosmetic Act, the substances in a hand antiseptic must *reasonably* be  
26 expected to become a component of food based upon the product's intended use.  
27 Where the substances in a hand antiseptic are reasonably expected to become a  
28 component of food based upon the product's intended use, circumstances under  
29 which those substances may be legally used include the following:

- 30 1. The intended use of a substance may be exempted from regulation

1 as a food additive under 21 CFR 170.39. *Threshold of regulation for*  
2 *substances used in food-contact articles.* A review by FDA's Center for Food  
3 Safety and Applied Nutrition is required in order to determine whether such  
4 an exemption can be granted.

5 2. A substance may be regulated for the intended use as a food additive under  
6 21 CFR 174 – *Indirect Food Additives – General*, and be listed along with  
7 conditions of safe use in 21 CFR 178 – *Indirect Food Additives: Adjuvants,*  
8 *Production Aids, and Sanitizers.*

9 3. The intended use of a substance, including substances that contact food  
10 such as those in hand antiseptics, may be “generally recognized as safe  
11 (GRAS)” within the meaning of the FFDCa. A partial listing of substances  
12 with food uses that are generally recognized as safe may be found in CFR  
13 Parts 182, 184, and 186. These lists are not exhaustive because the FFDCa  
14 allows for independent GRAS determinations.

15 For the use of a substance to be GRAS within the meaning of the FFDCa,  
16 there must be publicly available data that demonstrate that the substance is  
17 safe for its intended use. There also must be a basis to conclude that there  
18 is a consensus among qualified experts that these publicly available data  
19 establish safety. If the use of a substance in food is GRAS, it is not subject  
20 to premarket review by FDA. While there is no legal requirement to notify  
21 FDA of an independent GRAS determination, a number of firms have chosen  
22 to do so with the expectation of receiving a response letter from FDA (see  
23 FDA's Inventory of GRAS Notices at [http://www.cfsan.fda.gov/~rdb/opa-](http://www.cfsan.fda.gov/~rdb/opa-gras.html)  
24 [gras.html](http://www.cfsan.fda.gov/~rdb/opa-gras.html)). Although such a letter does not affirm the independent GRAS  
25 determination, it is an opportunity for the firm to receive comment from FDA  
26 regarding the materials supporting its determination.

27 4. A substance may be the subject of a Food Contact Substance Notification  
28 that became effective in accordance with the FFDCa Section 409 (h).  
29 Substances that are the subject of an effective food-contact substance  
30 notification are listed, along with conditions of safe use, in the FDA Inventory

1 of Effective Premarket Notifications for Food Contact Substances. This list  
2 is available on-line at <http://www.cfsan.fda.gov/~dms/opa-fcn.html>. A food-  
3 contact substance that is the subject of an effective notification submitted  
4 under FFDCFA 409(h) does not include similar or identical substances  
5 manufactured or prepared by any person other than the manufacturer  
6 identified in that notification.

7 The Division of Food Contact Substance Notifications does not certify or provide  
8 approvals for specific products. However, if the intended use of a substance in  
9 contact with food meets the requirements of 21 CFR 170.39 *Threshold of regulation*  
10 *for substances used in food-contact articles*, FDA may provide a letter to a firm  
11 stating that the intended use of this product is exempt from regulation as a food  
12 additive. However, the product must be the subject of a new drug application or  
13 under FDA's OTC Drug Review to be legally marketed.

14 Questions regarding the regulatory status of substances in hand antiseptics as food  
15 additives may be directed to the Division of Food Contact Substance Notifications,  
16 HFS-275, 5100 Paint Branch Parkway, College Park, MD 20740. It may be helpful  
17 or necessary to provide label/promotional information when inquiring about a  
18 specific substance.

19 ***Fingernails* 2-302.11 Maintenance.**

20 The requirement for fingernails to be trimmed, filed, and maintained is designed to  
21 address both the cleanability of areas beneath the fingernails and the possibility  
22 that fingernails or pieces of the fingernails may end up in the food due to breakage.

23 Failure to remove fecal material from beneath the fingernails after defecation can  
24 be a major source of pathogenic organisms. Ragged fingernails present  
25 cleanability concerns and may harbor pathogenic organisms.

26 ***Jewelry* 2-303.11 Prohibition.**

27 Items of jewelry such as rings, bracelets, and watches may collect soil and the  
28 construction of the jewelry may hinder routine cleaning. As a result, the jewelry may  
29 act as a reservoir of pathogenic organisms transmissible through food.

1 The term “jewelry” generally refers to the ornaments worn for personal adornment  
2 and medical alert bracelets do not fit this definition. However, the wearing of such  
3 bracelets carries the same potential for transmitting disease-causing organisms to  
4 food. If a food worker wears a medical alert or medical information bracelet, the  
5 conflict between this need and the Food Code’s requirements can be resolved  
6 through reasonable accommodation in accordance with the Americans with  
7 Disabilities Act. The person in charge should discuss the Food Code requirement  
8 with the employee and together they can work out an acceptable alternative to a  
9 bracelet. For example, the medical alert information could be worn in the form of a  
10 necklace or anklet to provide the necessary medical information without posing a  
11 risk to food. Alternatives to medical alert bracelets are available through a number  
12 of different companies (e.g., an internet search using the term “medical alert  
13 jewelry” leads to numerous suppliers).

14 An additional hazard associated with jewelry is the possibility that pieces of the item  
15 or the whole item itself may fall into the food being prepared. Hard foreign objects  
16 in food may cause medical problems for consumers, such as chipped and/or broken  
17 teeth and internal cuts and lesions.

18 ***Outer Clothing***                      **2-304.11**                      **Clean Condition.**

19 Dirty clothing may harbor diseases that are transmissible through food. Food  
20 employees who inadvertently touch their dirty clothing may contaminate their hands.

21 This could result in contamination of the food being prepared. Food may also be  
22 contaminated through direct contact with dirty clothing. In addition, employees  
23 wearing dirty clothes send a negative message to consumers about the level of  
24 sanitation in the establishment.

25 ***Food***                                      **2-401.11**                      **Eating, Drinking, or Using Tobacco.\***

26 ***Contamination***

27 ***Prevention***

1 Proper hygienic practices must be followed by food employees in performing  
2 assigned duties to ensure the safety of the food, prevent the introduction of foreign  
3 objects into the food, and minimize the possibility of transmitting disease through  
4 food. Smoking or eating by employees in food preparation areas is prohibited  
5 because of the potential that the hands, food, and food-contact surfaces may  
6 become contaminated. Insanitary personal practices such as scratching the head,  
7 placing the fingers in or about the mouth or nose, and indiscriminate and uncovered  
8 sneezing or coughing may result in food contamination. Poor hygienic practices by  
9 employees may also adversely affect consumer confidence in the establishment.  
10 Food preparation areas such as hot grills may have elevated temperatures and the  
11 excessive heat in these areas may present a medical risk to the workers as a result  
12 of dehydration. Consequently, in these areas food employees are allowed to drink  
13 from closed containers that are carefully handled.

14 **2-401.12 Discharges from the Eyes, Nose, and Mouth.\***

15 Discharges from the eyes, nose, or mouth through persistent sneezing or coughing  
16 by food employees can directly contaminate exposed food, equipment, utensils,  
17 linens, and single-service and single-use articles. When these poor hygienic  
18 practices cannot be controlled, the employee must be assigned to duties that  
19 minimize the potential for contaminating food and surrounding surfaces and  
20 objects.

21 ***Hair Restraints* 2-402.11 Effectiveness.**

22 Consumers are particularly sensitive to food contaminated by hair. Hair can be both  
23 a direct and indirect vehicle of contamination. Food employees may contaminate  
24 their hands when they touch their hair. A hair restraint keeps dislodged hair from  
25 ending up in the food and may deter employees from touching their hair.

1 Sources of molluscan shellfish are a particular concern because shellfish are  
2 frequently consumed raw or in an undercooked state and thus receive neither heat  
3 treatment nor any other process that would destroy or inactivate microbial  
4 pathogens. For safety, these foods must be accompanied by certification that  
5 documents that they have been harvested from waters that meet the water quality  
6 standards contained in the National Shellfish Sanitation Program Guide for the  
7 Control of Molluscan Shellfish. Certification also provides confidence that  
8 processing, packaging, and shipping have been conducted under sanitary  
9 conditions.

10 Food should be purchased from commercial supplies under regulatory control.  
11 Home kitchens, with their varieties of food and open entry to humans and pet  
12 animals, are frequently implicated in the microbial contamination of food. Because  
13 commercial items seldom are eaten right away, the home kitchen's limited capacity  
14 for maintaining food at proper temperatures may result in considerable microbial  
15 growth and toxin production by microorganisms introduced through the diverse  
16 sources of contamination. Controlled processing is required for the safe  
17 preparation of food entering commerce.

### 18 **Labeling – General**

19 Sources of packaged food must be labeled in accordance with law. Proper labeling  
20 of foods allows consumers to make informed decisions about what they eat. Many  
21 consumers, as a result of an existing medical condition, may be sensitive to specific  
22 foods or food ingredients. This sensitivity may result in dangerous medical  
23 consequences should certain foods or ingredients be unknowingly consumed. In  
24 addition, consumers have a basic right to be protected from misbranding and fraud.  
25 Except for certain species of large tuna and raw molluscan shellfish, if fish are  
26 intended for raw consumption, they must be properly frozen before they are served.

27 If this process is done off-premises, purchase specifications ensuring that proper  
28 freezing techniques are used to destroy parasites must be provided. Labeling  
29 should accompany the product to advise as to whether the product was frozen  
30 properly. This is necessary because fish from natural bodies of water may carry

1 parasitic worms that can infect and injure consumers who eat such raw fish dishes  
2 as sushi, ceviche, green (lightly marinated) herring, and cold-smoked salmon. The  
3 worms are often deeply imbedded inside fish muscle. Thorough freezing kills these  
4 worms if the fish are subjected to a low enough temperature for a long enough  
5 time.

### 6 **Labeling for Fish**

7 Except for certain species of large tuna and raw molluscan shellfish, if fish are  
8 intended for raw consumption, they must be properly frozen before they are  
9 served. If this process is done off-premises, purchase specifications ensuring that  
10 proper freezing techniques are used to destroy parasites must be provided.  
11 Labeling or other information should accompany the product to advise as to  
12 whether the product was frozen properly. This is necessary because fish from  
13 natural bodies of water may carry parasitic worms that can infect and injure  
14 consumers who eat such raw fish dishes as sushi, ceviche, green (lightly  
15 marinated) herring, and cold-smoked salmon. The worms are often deeply  
16 imbedded inside fish muscle. Thorough freezing kills these worms if the fish are  
17 subjected to a low enough temperature for a long enough time.

### 18 **Labeling for Juice**

19 On July 8, 1998, FDA announced in the Federal Register a final rule that revised  
20 its food labeling regulations to require a warning statement on fruit and vegetable  
21 juice products that have not been processed to prevent, reduce, or eliminate  
22 pathogenic microorganisms that may be present. FDA took this action to inform  
23 consumers, particularly those at greatest risk, of the hazard posed by such juice  
24 products. FDA expects that providing this information to consumers will allow them  
25 to make informed decisions on whether to purchase and consume such juice  
26 products, thereby reducing the incidence of foodborne illnesses and deaths caused  
27 by the consumption of these juices.

28 On July 18, 2001, FDA announced a final rule designed to improve the safety of  
29 fruit and vegetable juice and juice products. Under the rule, juice processors must  
30 use Hazard Analysis and Critical Control Point (HACCP) principles for juice

1 processing. Processors making shelf-stable juices or concentrates that use a single  
2 thermal processing step are exempt from the microbial hazard requirements of the  
3 HACCP regulation. Retail establishments where packaged juice is made and only  
4 sold directly to consumers (such as juice bars) are not required to comply with this  
5 regulation.

6 Rather, the Food Code requires fresh fruit or vegetable juices that are packaged at  
7 retail (untreated juices or beverages containing untreated juices that are offered to  
8 consumers as prepackaged foods) to be processed under HACCP with a 5 log  
9 reduction in pathogens of concern OR bear the warning statement as specified in  
10 21 CFR Section 101.17(g). That statement is: "WARNING: This product has not  
11 been pasteurized and, therefore, may contain harmful bacteria that can cause  
12 serious illness in children, the elderly, and persons with weakened immune  
13 systems." Refer to Chapter 1 for the definition of juice. It is important to note that  
14 the definition of "juice" includes puréed fruits and vegetables, which are commonly  
15 prepared for service to highly susceptible populations.

16 Food establishments that serve a highly susceptible population (HSP) cannot serve  
17 prepackaged juice that bears the warning label and they must serve only  
18 pasteurized juice. For juice only, this population includes children who are age 9 or  
19 less and receive food in a school, day care setting, or similar facility that provides  
20 custodial care.

21 Unpackaged juice (glasses of juice prepared at a juice bar, for example) does not  
22 require the 5 log reduction nor a warning statement or other consumer advisory  
23 (juice is not an animal food and therefore not covered by section 3-603.11) when  
24 prepared and served at retail. Usually the juice is served by the glass or in small  
25 batches compared to a commercial juice processor. The risk of using "drops" and  
26 damaged fruits or vegetables is much less at retail because of buyer specs that  
27 provide higher quality produce, meaning that fruits for juicing are less likely to be of  
28 a lower quality or damaged.

29 Additional information is available in the document, "Guidance for Industry.  
30 Warning and Notice Statement: Labeling of Juice Products, Small Entity

1 Compliance Guide” which can be found on the FDA website  
2 <http://www.cfsan.fda.gov/~dms/juicguid.html> or obtained from the FDA Office of  
3 Nutritional Products Labeling and Dietary Supplements.

#### 4 **Labeling for Meat and Poultry**

5 Retail food establishments that process and package meat or poultry in a form that  
6 is not ready-to-eat, are obligated by Federal regulation to label the product with  
7 safe food handling instructions. The intent of this requirement is to ensure that all  
8 consumers are alerted to the fact that such products may contain bacteria and that  
9 food safety hinges upon their thoroughly cooking the product, regardless of where  
10 they obtain the products. That is, the labeling would exist if they obtain their meat  
11 and poultry at an establishment that handles only prepackaged and pre-labeled  
12 products or if they obtain their meat or poultry at an operation such as a  
13 supermarket with a meat processing operation or from a small neighborhood  
14 butcher.

#### 15 **Labeling Guidance for Irradiated Raw Meat and Meat Products**

16 In December 1999, the U.S. Department of Agriculture, Food Safety and Inspection  
17 Service (USDA/FSIS) issued a final regulation to permit the use of ionizing radiation  
18 to reduce foodborne pathogens, including *Escherichia coli* O157:H7, and extend  
19 the shelf life of raw refrigerated and frozen meat and meat products (Irradiation of  
20 Meat Food Products 64 *Federal Register* 72150, December 23, 1999).

21 The final regulations are published in Title 9 of the Code of Federal Regulations (9  
22 CFR 424.21 Use of food ingredients and sources of radiation) and provide that raw  
23 refrigerated products may receive a maximum absorbed dose of no more than 4.5  
24 kGy, and that frozen products receive no more than 7.0 kGy, in accordance with  
25 the FDA restrictions provided for in Title 21 of the Code of Federal Regulations (21  
26 CFR 179.26(a) Ionizing radiation for the treatment of food, (a) Energy sources).  
27 The regulations further require that all irradiated meat and meat products bear  
28 labeling that reflects that the product was irradiated, or that the product contains an  
29 irradiated meat or poultry product. This labeling requirement is applicable even at  
30 retail facilities where irradiated coarse ground beef might be finely ground for retail

1 sale, or in cases where irradiated product is combined with other non-irradiated  
2 meat or poultry product for retail sale.

3 In cases where the entire package of product is irradiated, the labeling must include  
4 both a statement and the international symbol, called the radura. Additionally, the  
5 product name must include the word "irradiated," or the labeling must bear a  
6 disclosure statement such as, "treated with radiation" or "treated by irradiation." If  
7 either statement is used, the logo must be placed in conjunction with the statement.

8 If an irradiated meat or meat product is used to formulate a multi-ingredient product  
9 with other non-irradiated components, the irradiated meat ingredient must be  
10 identified as such in the ingredients statement, but the logo is not required. For  
11 example, the ingredients statement for a Chicken and Beef Sausage product that  
12 contains irradiated beef would be, Ingredients: chicken, irradiated beef, seasonings  
13 (salt, pepper, spice), and the logo would not be required to be present.

14 All labels for products produced at federally inspected establishments bearing  
15 statements about irradiation must be submitted to USDA/FSIS for evaluation and  
16 approval prior to use.

17 Optional labeling statements about the purpose of the irradiation process may be  
18 included on the labeling of irradiated products provided they are not false or  
19 misleading and have been evaluated first by USDA/FSIS. If such statements  
20 indicate a specific benefit from irradiation, such as a reduction of microbial  
21 pathogens, such statements must be substantiated by processing documentation  
22 and validated through the processing and Hazard Analysis and Critical Control  
23 Point (HACCP) system. Such validation and documentation of the HACCP system  
24 would only be applicable in federally inspected establishments.

25 Because irradiation can substantially reduce and, in some situations, eliminate any  
26 detectable level of pathogenic bacteria, it is important that the meat products be  
27 held at the proper refrigerated temperatures to prevent growth of any pathogens  
28 present, and that the packaging is not compromised. Although commingling  
29 irradiated beef with non-irradiated meat or poultry is not prohibited under the  
30 current regulations, USDA/FSIS believes that such a process would decrease the

1 benefit of irradiation by potentially exposing the irradiated product to pathogenic  
2 bacteria. While FSIS considers such commingling to be highly unlikely, if it did  
3 occur, a statement advising the consumer that the product contains both irradiated  
4 and non-irradiated components would be required.

5  
6 *The Radura, International Symbol:*

7  
8  
9 Further information about labeling irradiated raw meat is available through Directive  
10 7700.1, Irradiation of Meat and Poultry Products, on the USDA/FSIS website at  
11 <http://www.fsis.usda.gov/oppde/rdad/fsisdirectives/7700-1.htm>. Irradiation Questions &  
12 Answers can be found at <http://www.fsis.usda.gov/oppde/larc/policies/iradqa.pdf>.

### 13 **Labeling for Raw Shell Eggs**

14 The Code of Federal Regulations 21 CFR 101.17 **Food Labeling warning, notice,**  
15 **and safe handling statements**, paragraph (h) *Shell* eggs state in subparagraph  
16 (1), “The label of all shell eggs, whether in intrastate or interstate commerce, shall  
17 bear the following statement: „SAFE HANDLING INSTRUCTIONS: To prevent  
18 illness from bacteria; keep eggs refrigerated, cook eggs until yolks are firm, and  
19 cook foods containing eggs thoroughly.” Further, in subparagraph (4) it states,  
20 “Shell eggs that have been, before distribution to consumers, specifically processed  
21 to destroy all viable *Salmonella* shall be exempt from the requirements of paragraph  
22 (h) of this section.”

### 23 **Labeling for Whole-muscle, Intact Beef Steaks**

24 In order for a food establishment operator to know that a steak is a whole-muscle,  
25 intact cut of beef that can therefore be undercooked and served without a  
26 consumer advisory, the incoming product must be labeled. Processors can

1 accommodate this need at the retail level by developing proposed labels, obtaining  
2 the necessary USDA Food Safety Inspection Service review and approval, and  
3 appropriately affixing the labels to their products.

4 Refer also to public health reason for § 3-602.11.

### 5 **3-201.12 Food in a Hermetically Sealed Container.\***

6 Processing food at the proper high temperature for the appropriate time is essential  
7 to kill bacterial spores that, under certain conditions in an airtight container, begin to  
8 grow and produce toxin. Of special concern is the lethal toxin of ***Clostridium***  
9 ***botulinum***, an organism whose spores (i.e., survival stages for non-growth  
10 conditions) are found throughout the environment. Even slight underprocessing of  
11 low acid food which is canned can be dangerous, because spoilage microbes are  
12 killed and there are no signs to warn consumers that botulinum spores have  
13 germinated into vegetative cells and produced their toxin. If these foods are not  
14 processed to be commercially sterile, they must be received frozen or under proper  
15 refrigeration.

16 Refer also to the public health reason for §§ 3-101.11 and 3-201.11.

### 17 **3-201.13 Fluid Milk and Milk Products.\***

18 Milk, which is a staple for infants and very young children with incomplete immunity  
19 to infectious diseases, is susceptible to contamination with a variety of microbial  
20 pathogens such as Shiga toxin-producing ***Escherichia coli***, ***Salmonella*** spp., and  
21 ***Listeria monocytogenes***, and provides a rich medium for their growth. This is also  
22 true of milk products. Pasteurization is required to eliminate pathogen  
23 contamination in milk and products derived from milk. Dairy products are normally  
24 perishable and must be received under proper refrigeration conditions.

### 25 **3-201.14 Fish.\***

26 After December 18, 1997, all processors of fish are required by 21 CFR 123 to have  
27 conducted a hazard analysis of their operation, identify each hazard that is  
28 reasonably likely to occur, and implement a HACCP plan to control each identified  
29 hazard. Retailers should assure that their seafood suppliers have complied with  
30 this requirement. Hazards known to be associated with specific fish species are

1 discussed in the FDA Fish and Fishery Products Hazards and Controls Guide,  
2 available from the FDA Office of Seafood. Species-related hazards include  
3 pathogens, parasites, natural toxins, histamine, chemicals, and drugs.

4 The seafood implicated in histamine poisoning are the scombroid toxin-forming  
5 species, defined in 21 CFR 123.3(m) as meaning bluefish, mahi-mahi, tuna, and  
6 other species, whether or not in the family **Scombridae**, in which significant levels  
7 of histamine may be produced in the fish flesh by decarboxylation of free histidine  
8 as a result of exposure of the fish after capture to temperatures that allow the  
9 growth of mesophilic bacteria.

10 Ciguatera toxin is carried to humans by contaminated fin fish from the extreme  
11 southeastern U.S., Hawaii, and subtropical and tropical areas worldwide. In the  
12 south Florida, Bahamian, and Caribbean regions, barracuda, amberjack, horse-eye  
13 jack, black jack, other large species of jack, king mackerel, large groupers, and  
14 snappers are particularly likely to contain ciguatoxin. Many other species of large  
15 predatory fishes may be suspect. In Hawaii and throughout the central Pacific,  
16 barracuda, amberjack, and snapper are frequently ciguatoxic, and many other  
17 species both large and small are suspect. Mackerel and barracuda are frequently  
18 ciguatoxic from mid to northeastern Australian waters.

#### 19 RECREATIONALLY CAUGHT FISH

20 Recreationally caught fish received for sale or service may be approved by the  
21 regulatory authority. The EPA recognizes that fish are a healthy part of our diet and  
22 recognizes fishing as an all-American recreational pastime, however, they add the  
23 cautionary note that some individuals, such as pregnant women and small children,  
24 may need to limit their intake of certain noncommercial fish. Recreationally caught  
25 fish may contain possible contaminants that may pose health risks. Fish advisories  
26 can be found in EPA Listing of Fish Advisories the EPA website at:  
27 <http://www.epa.gov/waterscience/fish>.

28 States issue fish consumption advisories if elevated concentrations of chemicals  
29 such as mercury or dioxin are found in local fish. For most people, the risk from  
30 mercury by eating fish is not a health concern. Yet, some fish and shellfish contain

1 higher levels of mercury that may harm an unborn baby or young child's developing  
2 nervous system. Therefore, the FDA and the EPA recently advised women who  
3 may become pregnant, pregnant women, nursing mothers, and young children to  
4 avoid some types of fish and eat fish and shellfish that are lower in mercury.  
5 (<http://www.epa.gov/waterscience/fishadvice/advice.html>).

6 State-issued advisories apply primarily to non-commercial fish obtained through  
7 sport, recreation, and subsistence activities. Each advisory is different; it may  
8 recommend unrestricted, limited, or totally restricted consumption; may be targeted  
9 to everyone or limited to women, children, or other people at risk; and may apply to  
10 certain species or sizes of fish or a specific waterbody.

11 States may issue safe-eating guidelines in addition to issuing fish advisories. A fish  
12 advisory is issued to warn the public of the potential human health risks from  
13 chemical contamination of certain species from particular types of waterbodies such  
14 as lakes, rivers, and/or coastal waters within the State. In contrast, a safe-eating  
15 guideline is issued to inform the public that fish from specific waterbodies have  
16 been tested for chemical contaminants and the fish from these waters are safe to  
17 eat without consumption restrictions.

18 Regulatory authorities are encouraged to monitor and review the National Listing of  
19 Fish Advisories (See August 2004 EPA Fact Sheet at  
20 <http://www.epa.gov/waterscience/fish/advisories/factsheet.pdf> as well as the local  
21 listings, as part of the decision-making process regarding the approval of  
22 recreationally caught fish being used in food establishments.

### 23 **3-201.15 Molluscan Shellfish.\***

24 Pathogens found in waters from which molluscan shellfish are harvested can cause  
25 disease in consumers. Molluscan shellfish include: 1) oysters; 2) clams; 3)  
26 mussels; and, 4) scallops, except where the final product is the shucked adductor  
27 muscle only. The pathogens of concern include both bacteria and viruses.

28 Pathogens from the harvest area are of particular concern in molluscan shellfish  
29 because: 1) environments in which molluscan shellfish grow are commonly subject  
30 to contamination from sewage, which may contain pathogens, and to naturally

1 occurring bacteria, which may also be pathogens; 2) molluscan shellfish filter and  
2 concentrate pathogens that may be present in surrounding waters; and, 3)  
3 molluscan shellfish are often consumed whole, either raw or partially cooked.

4 To minimize the risk of molluscan shellfish containing pathogens of sewage origin,  
5 State and foreign government agencies, called Shellfish Control Authorities, classify  
6 waters in which molluscan shellfish are found, based, in part, on an assessment of  
7 water quality. As a result of these classifications, molluscan shellfish harvesting is  
8 allowed from some waters, not from others, and only at certain times or under  
9 certain restrictions from others. Shellfish Control Authorities then exercise control  
10 over the molluscan shellfish harvesters to ensure that harvesting takes place only  
11 when and where it has been allowed.

12 Significant elements of Shellfish Control Authorities' efforts to control the harvesting  
13 of molluscan shellfish include: 1) a requirement that containers of in-shell  
14 molluscan shellfish (shellstock) bear a tag that identifies the type and quantity of  
15 shellfish, harvester, harvest location, and date of harvest; and, 2) a requirement that  
16 molluscan shellfish harvesters be licensed; 3) a requirement that processors that  
17 shuck molluscan shellfish or ship, reship, or repack the shucked product be  
18 certified; and, 4) a requirement that containers of shucked molluscan shellfish bear  
19 a label with the name, address, and certification number of the shucker-packer or  
20 repacker.

21 Pathogens, such as *Vibrio vulnificus*, *Vibrio parahaemolyticus*, *Vibrio cholerae*,  
22 and *Listeria monocytogenes* that may be present in low numbers at the time that  
23 molluscan shellfish are harvested, may increase to more hazardous levels if they  
24 are exposed to time/temperature abuse. To minimize the risk of pathogen growth,  
25 Shellfish Control Authorities place limits on the time between harvest and  
26 refrigeration. The length of time is dependant upon either the month of the year or  
27 the average monthly maximum air temperature (AMMAT) at the time of harvest,  
28 which is determined by the Shellfish Control Authority.

29 Paralytic shellfish poisoning (PSP) results from shellfish feeding upon toxic  
30 microorganisms such as dinoflagellates. In the U.S., PSP is generally associated

1 with the consumption of molluscan shellfish from the northeast and northwest  
2 coastal regions of the U.S. PSP in other parts of the world has been associated with  
3 molluscan shellfish from environments ranging from tropical to temperate waters. In  
4 addition, in the U.S., PSP toxin has recently been reported from the viscera of  
5 mackerel, lobster, dungeness crabs, tanner crabs, and red rock crabs.

6 Neurotoxic shellfish poisoning (NSP) in the U.S. is generally associated with the  
7 consumption of molluscan shellfish harvested along the coast of the Gulf of Mexico,  
8 and, sporadically, along the southern Atlantic coast. There has been a significant  
9 occurrence of toxins similar to NSP in New Zealand, and some suggestions of  
10 occurrence elsewhere.

11 For diarrhetic shellfish poisoning there has been no documented occurrence to date  
12 in the U.S. However, instances have been documented in Japan, southeast Asia,  
13 Scandinavia, western Europe, Chile, New Zealand, and eastern Canada.

14 Amnesic shellfish poisoning (ASP) is generally associated with the consumption of  
15 molluscan shellfish from the northeast and northwest coasts of North America. It  
16 has not yet been a problem in the Gulf of Mexico, although the algae that produce  
17 the toxin have been found there. ASP toxin has recently been identified as a  
18 problem in the viscera of dungeness crab, tanner crab, red rock crab, and  
19 anchovies along the west coast of the United States.

20 Marine toxins are not ordinarily a problem in scallops if only the adductor muscle is  
21 consumed. However, products such as roe-on scallops and whole scallops do  
22 present a potential hazard for natural toxins.

23 To reduce the risk of illness associated with raw shellfish consumption, the Food  
24 and Drug Administration (FDA) administers the National Shellfish Sanitation  
25 Program (NSSP). The NSSP is a tripartite, cooperative action plan involving  
26 Federal and State public health officials and the shellfish industry. Those groups  
27 work together to improve shellfish safety. States regularly monitor waters to ensure  
28 that they are safe before harvesting is permitted. FDA routinely audits the States'  
29 classification of shellfish harvesting areas to verify that none pose a threat to public  
30 health. Patrolling of closed shellfishing waters minimizes the threat of illegal

1 harvesting or “bootlegging” from closed waters. Bootlegging is a criminal activity  
2 and a major factor in shellfish-borne illnesses. Purchases from certified dealers  
3 that adhere to NSSP controls is essential to keep risks to a minimum.

#### 4 **3-201.16 Wild Mushrooms.\***

5 Over 5000 species of fleshy mushrooms grow naturally in North America. The vast  
6 majority have never been tested for toxicity. It is known that about 15 species are  
7 deadly and another 60 are toxic to humans whether they are consumed raw or  
8 cooked. An additional 36 species are suspected of being poisonous, whether raw  
9 or cooked. At least 40 other species are poisonous if eaten raw, but are safe after  
10 proper cooking.

11 Some wild mushrooms that are extremely poisonous may be difficult to distinguish  
12 from edible species. In most parts of the country there is at least one organization  
13 that include individuals who can provide assistance with both identification and  
14 program design. Governmental agencies, universities, and mycological societies  
15 are examples of such groups. If a food establishment chooses to sell wild  
16 mushrooms, management must recognize and address the need for a sound  
17 identification program for providing safe wild mushrooms.

18 Regulatory authorities have expressed their difficulty in determining what  
19 constitutes a “wild mushroom identification expert” and enforcing the Food Code  
20 provisions associated with it. In 1998, the Conference for Food Protection (CFP)  
21 attempted to alleviate this problem through the formation of a committee that was  
22 charged with determining what constitutes a wild mushroom expert. However, the  
23 committee was unable to provide this information in a practical, useful manner for  
24 State and local regulators within the constraints of the Food Code. The 2000 CFP  
25 recommended and FDA accepted the committee’s alternative solution that a  
26 brochure be developed that will provide information on what constitutes a wild  
27 mushroom expert, and to replace “identification by a wild mushroom expert” with  
28 “written buyer specifications.”

29 The CFP’s recommendation attempts to provide the necessary information in a  
30 practical, useful manner for all stakeholders, and yet still convey the highest level of

1 public health protection. The CFP committee suggested that written buyer  
2 specifications place more responsibility on the food establishment to ensure that  
3 wild mushrooms are obtained from a safe source, and also provides State and local  
4 regulators a template to use in ensuring wild mushrooms sold at retail are obtained  
5 from a safe source.

6 However, the recommendation for written buyer specifications will not replace Food  
7 Code paragraph 3-201.16(A) until the brochure is developed and accepted by the  
8 CFP and FDA. In the interim, the following guidance is provided regarding the  
9 identification of wild mushrooms:

10 A food establishment that sells or serves mushroom species picked in the wild shall  
11 have a written buyer specification that requires identification of:

- 12 (1) The Latin binomial name, the author of the name, and the common  
13 name of the mushroom species,
- 14 (2) That the mushroom was identified while in the fresh state,
- 15 (3) The name of the person who identified the mushroom,
- 16 (4) A statement as to the qualifications and training of the identifier,  
17 specifically related to mushroom identification.

18 Additional information can be found on the California Poison Control website:  
19 <http://www.calpoison.org/public/mushrooms.html>.

20 Refer also to the public health reason for §§ 3-101.11 and 3-201.11.

### 21 **3-201.17 Game Animals.\***

22 The primary concern regarding game animals relates to animals obtained in the  
23 wild. Wild game animals may be available as a source of food only if a regulatory  
24 inspection program is in place to ensure that wild animal products are safe. This is  
25 important because wild animals may be carriers of viruses, rickettsiae, bacteria, or  
26 parasites that cause illness (zoonoses) in humans. Some of these diseases can be  
27 severe in the human host. In addition to the risk posed to consumers of game that  
28 is not subject to an inspection program, there is risk to those who harvest and  
29 prepare wild game because they may contract infectious diseases such as rabies or  
30 tularemia.

1           **Specifications**                   **3-202.11**    **Temperature.\***  
2           **for Receiving**

3           Temperature is one of the prime factors that controls the growth of bacteria in food.  
4           Many, though not all, types of pathogens and spoilage bacteria are prevented from  
5           multiplying to microbiologically significant levels in properly refrigerated foods that  
6           are not out of date. USDA published a final rule (63 FR 45663, August 27, 1998  
7           Shell Eggs; Refrigeration and Labeling Requirements) to require that shell eggs  
8           packed for consumer use be stored and transported at an ambient temperature not  
9           to exceed 7.2°C (45°F).

10          High temperatures for a long enough time, such as those associated with thorough  
11          cooking, kill or inactivate many types of microorganisms. However, cooking does  
12          not always destroy the toxins produced in foods by certain bacteria (such as the  
13          enterotoxins of ***Staphylococcus aureus***). Cooking or hot holding that follows  
14          temperature abuse may not make the food safe. Keeping cooked foods hot as  
15          required in the Code prevents significant regrowth of heat-injured microorganisms  
16          and prevents recontamination with bacteria that are newly introduced.

17   **3-202.12**    **Additives.\***

18          It is imperative for safety that food supplies come from sources that are in  
19          compliance with laws regarding chemical additives and contaminants.

20          Food additives are substances which, by their intended use, become components of  
21          food, either directly or indirectly. They must be strictly regulated. In excessive  
22          amounts or as a result of unapproved application, additives may be harmful to the  
23          consumer. Unintentional contaminants or residues also find their way into the food  
24          supply. The tolerances or safe limits designated for these chemicals are  
25          determined by risk assessment evaluations based on toxicity studies and  
26          consumption estimates.

27          Food and Color additives must be used in compliance with a federal food, or color  
28          additive regulation, an effective food-contact notification, or a threshold of  
29          regulation exemption. Such regulations, notifications, and exemptions are generally  
30          composed of three parts: the *identity* of the substance, *specifications* including

1 purity or physical properties, and *limitations* on the conditions of use. In order for a  
2 food, or color additive use to be in compliance, the use must comply with all three  
3 criteria.

4 Federal Food Additive regulations are found in Title 21 CFR, Parts 172-180. Color  
5 additive regulations are found in Title 21 CFR Parts 73-Subpart A, 74-Subpart A, 81  
6 and 82. Effective food-contact notifications are listed at  
7 <http://vm.cfsan.fda.gov/~dms/opa-fcn.html>, and threshold of regulation exemptions  
8 are listed at <http://www.cfsan.fda.gov/~dms/opa-torx.html>.

9 Other substances that are added to food include those prior sanctioned for use in  
10 food by either the FDA or USDA, or those generally recognized as safe for their  
11 intended use in food. Some of these are listed in Title 21 CFR Parts 181-186, Title  
12 9 CFR Section 424.21(b) and at <http://www.cfsan.fda.gov/~rdb/opa-gras.html>.  
13 Tolerances and exemptions from tolerance for pesticide chemical residues in or on  
14 food are found in Title 40 CFR Part 180. Substances that are prohibited from use in  
15 human food are listed in Title 21 CFR Part 189.

### 16 **3-202.13 Eggs.\***

17 Damaged shells permit the entry of surface bacteria to the inside of eggs. Eggs are  
18 an especially good growth medium for many types of bacteria. Damaged eggs must  
19 not be used as food.

20 The Definition of “Restricted Egg” contains several terms that are explained in this  
21 paragraph. An egg may be restricted because it is a/an:

- 22 (i) “Check” meaning an egg that has a broken shell or crack in the shell  
23 but has its shell membranes intact and contents not leaking.
- 24 (ii) “Dirty egg or Dirties” meaning an egg that has a shell that is unbroken  
25 and has adhering dirt, foreign material, or prominent stains.
- 26 (iii) “Incubator reject” meaning an egg that has been subjected to  
27 incubation and has been removed from incubation during the  
28 hatching operations as infertile or otherwise unhatchable.
- 29 (iv) “Inedible” meaning eggs of the following descriptions: Black rots,  
30 yellow rots, white rots, mixed rots, sour eggs, eggs with green whites,

1 eggs with stuck yolks, moldy eggs, musty eggs, eggs showing blood  
2 rings, and eggs containing embryo chicks (at or beyond the blood ring  
3 stage).

4 (v) "Leaker" meaning an egg that has a crack or break in the shell and  
5 shell membranes to the extent that the egg contents are exposed or  
6 are exuding or free to exude through the shell.

7 (vi) "Loss" meaning an egg that is unfit for human food because it is  
8 smashed or broken so that its contents are leaking; or overheated,  
9 frozen, or contaminated; or an incubator reject; or because it contains  
10 a bloody white, large meat spots, a large quantity of blood, or other  
11 foreign material.

12 On December 5, 2000, Federal regulations were amended to require that shell egg  
13 cartons bear safe handling instructions and be placed under refrigeration at 45°F or  
14 lower upon delivery at retail establishments (65 FR 76091, December 5, 2000, Food  
15 Labeling, Safe Handling Statements, Labeling of Shell Eggs; Refrigeration of Shell  
16 Eggs Held for Retail Distribution). The amended provisions include:

- 17 • 21 CFR Part 16 Regulatory Hearing before the Food and Drug  
18 Administration, § 16.5 Inapplicability and limited applicability, (4) A  
19 hearing on an order for re-labeling, diversion or destruction of shell  
20 eggs...
- 21 • 21 CFR Part 101 Food Labeling §101.17 Food labeling warning,  
22 notice, and safe handling statements, (h) *Shell eggs*.
- 23 • 21 CFR Part 115 Shell Eggs, § 115.50. Refrigeration of shell eggs  
24 held for retail distribution.

25 The labeling rule became effective September 4, 2001, and the refrigeration rule  
26 became effective June 4, 2001. These rules are one part of a larger farm-to-table  
27 approach for ensuring the safety of our nation's egg supply. The public health goal  
28 is a 50 percent reduction in all salmonellosis and a 50 percent reduction in  
29 ***Salmonellae Enteritidis*** illnesses by 2010.

30 **3-202.14 Eggs and Milk Products, Pasteurized.\***

1 Liquid egg, fluid milk, and milk products are especially good growth media for many  
2 types of bacteria and must be pasteurized. Pasteurization is a heat process that  
3 will kill or inactivate bacteria and other harmful microorganisms likely to be in these  
4 potentially hazardous foods (time/temperature control for safety foods). Freezing  
5 and drying of unpasteurized products will stop microbial growth and may reduce  
6 their bacterial populations; however, some organisms will survive because neither  
7 process invariably kills bacteria. Under certain conditions, freezing and drying may  
8 preserve microbes. An alternative to pasteurization may be applicable to certain  
9 cheese varieties cured or aged for a specified amount of time prior to marketing for  
10 consumption.

11 **3-202.15 Package Integrity.\***

12 Damaged or incorrectly applied packaging may allow the entry of bacteria or other  
13 contaminants into the contained food. If the integrity of the packaging has been  
14 compromised, contaminants such as *Clostridium botulinum* may find their way  
15 into the food. In anaerobic conditions (lack of oxygen), botulism toxin may be  
16 formed.

17 Packaging defects may not be readily apparent. This is particularly the case with  
18 low acid canned foods. Close inspection of cans for imperfections or damage may  
19 reveal punctures or seam defects. In many cases, suspect packaging may have to  
20 be inspected by trained persons using magnifying equipment. Irreversible and even  
21 reversible swelling of cans (hard swells and flippers) may indicate can damage or  
22 imperfections (lack of an airtight, i.e., hermetic seal). Swollen cans may also  
23 indicate that not enough heat was applied during processing (underprocessing).  
24 Suspect cans must be returned and not offered for sale.

25 **3-202.16 Ice.\***

26 Freezing does not invariably kill microorganisms; on the contrary, it may  
27 preserve them. Therefore, ice that comes into contact with food to cool it or that is  
28 used directly for consumption must be as safe as drinking water that is periodically  
29 tested and approved for consumption.

30 **3-202.17 Shucked Shellfish, Packaging and Identification.**

1 Plastic containers commonly used throughout the shellfish industry for shucked  
2 product bear specific information regarding the source of the shellfish as required  
3 by the NSSP Guide for the Control of Molluscan Shellfish. These containers must  
4 be nonreturnable so that there is no potential for their subsequent reuse by shellfish  
5 packers which could result in shucked product that is inaccurately  
6 identified by the label. The reuse of these containers within the food  
7 establishment must be assessed on the basis of the Food Code's criteria  
8 for multi-use containers and the likelihood that they will be properly  
9 relabeled to reflect their new contents.

10 **3-202.18 Shellstock Identification.\***

11 Accurate source identification of the harvesting area, harvester, and dealers  
12 must be contained on molluscan shellstock identification tags so that if a  
13 shellfish-borne disease outbreak occurs, the information is available to  
14 expedite the epidemiological investigation and regulatory action.

15 **3-202.19 Shellstock, Condition.**

16 Dirty, damaged, or dead shellstock can contaminate and degrade live and  
17 healthy shellstock and lead to foodborne illness. Harvesters have the  
18 primary responsibility for culling shellstock, but this responsibility continues  
19 throughout the distribution chain.

20 **3-202.110 Juice Treated.**

21 Refer to public health reason for § 3-801.11.

22 ***Original* 3-203.11 Molluscan Shellfish, Original Container.**

23 ***Containers and***

24 ***Records***

25 Lot separation is critical to isolating shellfish implicated in illness outbreaks  
26 and tracking them to their source. Proper identification is needed for tracing  
27 the origin and determining conditions of shellfish processing and shipment. If  
28 the lots are commingled at retail, traceability is undermined and the root of  
29 the problem may remain undetected. If no causative factors are identified  
30 in the food establishment, tracing the incriminated lot helps in identifying

1 products that need to be recalled or growing waters that may need to be  
2 closed to harvesting.

3 When shucked shellfish are prepackaged in consumer self service  
4 containers, the labeling information as specified under section 3-202.17 must  
5 be recorded on a log sheet to correlate with the date of sale of the  
6 consumer sized containers.

7 **3-203.12 Shellstock, Maintaining Identification.\***

8 Accurate records that are maintained in a manner that allows them to be  
9 readily matched to each lot of shellstock provide the principal mechanism for  
10 tracing shellstock to its original source. If an outbreak occurs, regulatory  
11 authorities must move quickly to close affected growing areas or take other  
12 appropriate actions to prevent further illnesses. Records must be kept for  
13 90 days to allow time for hepatitis A virus infections, which have an  
14 incubation period that is significantly longer than other shellfish-borne  
15 diseases, to come to light. The 90 day requirement is based on the  
16 following considerations:

17	Shelf-life of the product.....	14 days
18	Incubation period .....	56 days
19	Medical diagnosis and confirmation.....	5 days
20	Reporting .....	5 days
21	<u>Epidemiological investigation .....</u>	<u>10 days</u>
22	Total .....	90 days

23 In reality and as stated in the provision, the 90-day “clock” starts at the  
24 time the container of shellstock is emptied. Starting from the date of  
25 harvest is not correct because the shellstock may be sold/consumed in less  
26 than the 14 days of shelf life cited in the chart above. Therefore, the 90  
27 days may expire and the tag discarded before an illness is reported and  
28 investigated.

29 Shellstock could be frozen in the food establishment during the 14-day  
30 estimated shelf life period, which would effectively stop the clock on the

1 shelf life. The shellstock could be thawed and consumed past the 14-day  
2 shelf life. In this case, the 90 days would expire before consumption if the  
3 clock started 90 days from the harvest date.

4 Freezing shellstock in the food establishment is not usually done because,  
5 although oysters-in-the-shell can be frozen with fair results, they do not  
6 have the same texture and appearance of a fresh oyster when thawed.  
7 Commercially frozen oysters are frozen rapidly to retain product quality.

8 ***Preventing 3-301.11 Preventing Contamination from Hands.\****  
9 ***Contamination***  
10 ***by Employees***

11 In November 1999, the National Advisory Committee for Microbiological  
12 Criteria for Foods (NACMCF) concluded that bare hand contact with ready-  
13 to-eat foods can contribute to the transmission of foodborne illness and  
14 agreed that the transmission could be interrupted. The NACMCF  
15 recommended exclusion/restriction of ill food workers as the first preventative  
16 strategy and recognized that this intervention has limitations, such as trying  
17 to identify and manage asymptomatic food workers.

18 The three interdependent critical factors in reducing foodborne illness  
19 transmitted through the fecal-oral route, identified by the NACMCF, include  
20 exclusion/restriction of ill food workers; proper handwashing; and no bare  
21 hand contact with ready-to-eat foods. Each of these factors is inadequate  
22 when utilized independently and may not be effective. However, when all  
23 three factors are combined and utilized properly, the transmission of fecal-  
24 oral pathogens can be controlled. Depending on the microbial contamination  
25 level on the hands, handwashing with plain soap and water, as specified  
26 in the Food Code, may not be an adequate intervention to prevent the  
27 transmission of pathogenic microbes to ready-to-eat foods via hand contact  
28 with ready-to-eat foods. Handwashing as specified in the Food Code will  
29 reduce microbial contamination of the hands by 2-3 logs.

1 Food employees and conditional employees infected with fecal-oral  
2 pathogens can shed viral and protozoan pathogens in the feces at levels up  
3 to 10<sup>8</sup> viral particles or oocysts per gram of feces. Having a high potential  
4 contamination level on the hands combined with a very low infectious dose  
5 necessary to cause infection are the reasons that FDA believes that  
6 handwashing alone is not an effective single barrier in the transmission  
7 of these fecal-oral pathogens. The infective dose for **Giardia** and  
8 **Cryptosporidium** is believed to be as low as 1-10 oocysts, and as few as  
9 10 virus particles can infect an individual with Norovirus or hepatitis A.

10 The CDC now estimates that Norovirus is the leading cause of foodborne  
11 illness in the United States. Contaminated hands are a significant factor  
12 in the transmission of enteric viruses, including Norovirus and hepatitis A  
13 virus. Further, contamination of food by an infected food worker is the  
14 most common mode of transmission of hepatitis A in foodborne disease  
15 outbreaks. Research has shown the viral transfer rate from contaminated  
16 hands to ready-to-eat food to be about 10% and that proper handwashing  
17 will significantly reduce the chance of transmitting pathogenic viruses.  
18 However, with heavy initial contamination of the hands, especially in the  
19 subungal space of the fingers, a basic 2-3 log reduction handwash  
20 procedure may not be adequate to prevent the transmission of viral  
21 foodborne illness.

22 Even though bare hands should never contact exposed, ready-to-eat food,  
23 thorough handwashing is important in keeping gloves or other utensils from  
24 becoming vehicles for transferring microbes to the food.

25 Refer to the public health reasons for §§ 2-301.11, 2-301.12, and 2-301.14.

26 **3-301.11(D) Prior Approval for Food Employees to**  
27 **Touch Ready-to-Eat Food with Bare Hands**

28 Infected food employees are the source of contamination in approximately  
29 one in five foodborne disease outbreaks reported in the United States with

1 a bacterial or viral cause.<sup>1</sup> Most of these outbreaks involve enteric, i.e.,  
2 fecal-oral agents. These are organisms that employees were shedding in  
3 their stools at the time the food was prepared. Because of poor or  
4 nonexistent handwashing procedures, workers spread these organisms to  
5 the food. In addition, infected cuts, burns, or boils on hands can also  
6 result in contamination of food. Viral, bacterial, and parasitic agents can  
7 be involved.

8 Traditionally, food regulations have required two methods of preventing the  
9 spread of foodborne disease by this mode of transfer, i.e., they have  
10 prohibited food workers from preparing food when they are infectious and  
11 have required thorough and frequent handwashing. In order to strengthen  
12 fecal-oral transmission interventions, the Food Code provides focused and  
13 specific guidance about ill workers and when handwashing must occur. As  
14 a final barrier, bare-hand contact with ready-to-eat food (i.e., food that is  
15 edible without washing or is not subsequently subjected to a pathogen kill  
16 step) is prohibited and suitable utensils such as spatulas, tongs, single-use  
17 gloves, or dispensing equipment are required to be used. Any alternative to  
18 this requirement must convincingly address how food employees will be  
19 managed to preclude food contamination and how management will ensure  
20 that thorough handwashing occurs after employees use the toilet.

21 **Because highly susceptible populations include persons who are**  
22 **immunocompromised, the very young and elderly, establishments serving**  
23 **these populations may not use alternatives to the no bare hand contact**  
24 **with ready-to-eat food requirement.**

25 Acceptability of an alternative procedure to no bare hand contact requires  
26 prior approval from the regulatory authority based on the food establishment  
27 having a written employee health policy that details how the establishment

---

<sup>1</sup>Based on CDC Summary Surveillance for Foodborne-Disease Outbreaks – United States, 1988-1992 and New York State Department of Health data 1980-1991 published: Weingold, Guzewich, Fudala, 1994, Use of Foodborne Disease Data for HACCP Risk Assessment. J. Food Prot. 53: 820-830.

1 complies with management of ill employees as specified under sections 2-  
2 201.11 - .13 and management of handwashing practices as specified under  
3 Part 2-3 of the Code. The approval should also be based on evidence  
4 provided through written procedures and documentation that at least all of  
5 the following are addressed:

6 (A) **Personal Cleanliness, i.e., handwashing** procedures, including  
7 frequency and methodology of handwashing that ensure food employees keep  
8 their hands and fingertips clean and handwashing occurs at the times  
9 specified in section 2-301.14, including after using the toilet and between tasks  
10 that may recontaminate the hands.

11 (B) **Hygienic Practices** as specified in Part 2-4.

12 (C) **Employee Health** regarding:

13 (1) **Reporting of diseases and medical conditions**, and

14 (2) **Exclusions and restrictions**, i.e., that food employees and  
15 conditional employees report their health status as specified in  
16 section 2-201.11; ill food employees are restricted or excluded as  
17 specified in section 2-201.12; and the exclusions and restrictions are  
18 removed as specified in section 2-201.13;

19 (D) **How the alternative practices and procedures will control the hazard**  
20 **through an active managerial control program.** Such a program  
21 includes monitoring and verifying the institution of the provisions  
22 described in paragraphs A-C above and satisfies the following:

23 (1) The public health hazard associated with bare hand contact  
24 specific to the food establishment operation is identified and understood.  
25 The regulatory authority needs assurance that the permit holder  
26 recognizes that the hazard being addressed is the possible  
27 contamination of ready-to-eat food by viral and parasitic as well as  
28 bacterial pathogens that are transferred from employees' hands.

29 (2) The ready-to-eat foods that will be contacted with bare hands are  
30 identified and both procedures and practices are in place so that

1 food employees wash their hands before returning to their work station  
2 and cross-contamination from touching raw and ready-to-eat food is  
3 precluded.

4 For example, identifying the specific type of food to be prepared,  
5 such as tacos, and the specific location, such as a situation where a  
6 food employee is assigned solely to the designated taco work  
7 station. The work station is located immediately adjacent to the taco  
8 assembly unit and the employee will be preparing only the specified  
9 ready-to-eat food using bare hands.

10 Another example could be a food employee who is responsible solely for  
11 assembling a variety of ready-to-eat foods.

12 (3) Institution of an effective training program for food employees that  
13 emphasizes not working when ill with any of the gastrointestinal  
14 symptoms listed in the Code, and explains good hygienic practices,  
15 proper handwashing procedures, and safe food preparation  
16 procedures. This should include a documented training plan that  
17 specifies how management responsibility for training has been  
18 designated, training program content, and the frequency of  
19 administration including periodic refresher sessions.

20 (E) The alternative procedure should clearly describe monitoring,  
21 documentation, and verification actions to ensure that the practices and  
22 procedures are followed. Corrective actions need to be predetermined for  
23 situations where the practices and procedures are not followed, e.g., an  
24 ill employee is found preparing foods.

25 (F) Documentation of the practices, procedures, and corrective actions  
26 related to an alternative to no bare hand contact with ready-to-eat food  
27 must be maintained and readily available at the food establishment at all  
28 times for use by the person in charge and for review by the regulatory  
29 authority.

30 **Preventing 3-302.11 Packaged and Unpackaged Food – Protection**

1                    **Food and                    Separation, Packaging, and Segregation.\***  
2                    **Ingredient Contamination**

3                    With regard to the storage of raw animal foods as specified under  
4                    subparagraph 3-302.11(A)(2), it is the intent of this Code to require  
5                    separation based on anticipated microbial load and raw animal food type  
6                    (species). Raw animal foods shall be separated based on a succession of  
7                    cooking temperatures since cooking temperatures as specified under § 3-  
8                    401.11 are based on thermal destruction data and anticipated microbial  
9                    load. For example, to prevent cross-contamination, fish and pork, which are  
10                    required to be cooked to an internal temperature of 145°F for 15 seconds,  
11                    shall be stored above or away from raw poultry, which is required to be  
12                    cooked to an internal temperature of 165°F for 15 seconds due to its  
13                    considerably higher anticipated microbial load. In addition, raw animal foods  
14                    having the same cooking temperature, such as pork and fish, shall be  
15                    separated from one another during storage and preparation by maintaining  
16                    adequate spacing or by placing the food in separate containers because of  
17                    the potential for allergen cross-contamination or economic adulteration via  
18                    inadvertent species substitution.

19                    Food that is inadequately packaged or contained in damaged packaging  
20                    could become contaminated by microbes, dust, or chemicals introduced by  
21                    products or equipment stored in close proximity or by persons delivering,  
22                    stocking, or opening packages or overwraps. Packaging must be  
23                    appropriate for preventing the entry of microbes and other contaminants  
24                    such as chemicals. These contaminants may be present on the outside of  
25                    containers and may contaminate food if the packaging is inadequate or  
26                    damaged, or when the packaging is opened. The removal of food product  
27                    overwraps may also damage the package integrity of foods under the  
28                    overwraps if proper care is not taken.

29                    **3-302.12      Food Storage Containers, Identified with Common**  
30                    **Name of Food.**

1 Certain foods may be difficult to identify after they are removed from their  
2 original packaging. Consumers may be allergic to certain foods or  
3 ingredients.

4 The mistaken use of an ingredient, when the consumer has specifically  
5 requested that it not be used, may result in severe medical consequences.

6 The mistaken use of food from unlabeled containers could result in chemical  
7 poisoning. For example, foodborne illness and death have resulted from the  
8 use of unlabeled salt, instead of sugar, in infant formula and special dietary  
9 foods. Liquid foods, such as oils, and granular foods that may resemble  
10 cleaning compounds are also of particular concern.

11 **3-302.13 Pasteurized Eggs, Substitute for Raw Shell Eggs for**  
12 **Certain Recipes.\***

13 Raw or undercooked eggs that are used in certain dressings or sauces are  
14 particularly hazardous because the virulent organism **Salmonella Enteritidis**  
15 may be present in raw shell eggs. Pasteurized eggs provide an egg  
16 product that is free of pathogens and is a ready-to-eat food. The  
17 pasteurized product should be substituted in a recipe that requires raw or  
18 undercooked eggs.

19 **3-302.14 Protection from Unapproved Additives.\***

20 Refer to the public health reason for § 3-202.12.

21 Use of unapproved additives, or the use of approved additives in amounts  
22 exceeding those allowed by food additive regulations could result in  
23 foodborne illness, including allergic reactions. For example, many adverse  
24 reactions have occurred because of the indiscriminate use of sulfites to  
25 retard “browning” of fruits and vegetables or to cause ground meat to look  
26 “redder” or fresher.

27 The concern for misuse of additives also applies to food establishments  
28 operating under a variance and to Annex 6 Food Processing Criteria of  
29 Model Food Code which addresses the use of sodium nitrite or other curing  
30 agents in smoking and curing operations. However, if this process is done

1 incorrectly, it could cause illness or death because of excessive nitrite or  
2 because the food is insufficiently preserved.

3 **3-302.15 Washing Fruits and Vegetables.**

4 Pathogenic organisms and chemicals may be present on the exterior  
5 surfaces of raw fruits and vegetables. Washing removes the majority of  
6 organisms and/or chemicals present. If nondrinking water is used, the fruits and  
7 vegetables could become contaminated.

8 Toxic or undesirable residues could be present in or on the food if  
9 chemicals used for washing purposes are unapproved or applied in  
10 excessive concentrations.

11 On October 26, 1998, a voluntary guidance document which addresses  
12 practices commonly used by fresh fruit and vegetable producers was issued  
13 jointly by FDA, USDA, and CDC. This voluntary guidance contains useful  
14 information related to washing fruits and vegetables as well as the  
15 application of antimicrobial agents. The "Guide to Minimize Microbial Food  
16 Safety Hazards for Fresh Fruits and Vegetables" is available from FDA's  
17 Food Safety Initiative staff and also on the Internet at  
18 <http://www.fda.gov/dms/prodguid.html>.

19 ***Preventing* 3-303.11 *Ice Used as Exterior Coolant, Prohibited as***  
20 ***Contamination* *Ingredient.***  
21 ***from Ice Used***  
22 ***as a Coolant***

23 Ice that has been in contact with unsanitized surfaces or raw animal foods  
24 may contain pathogens and other contaminants. For example, ice used to  
25 store or display fish or packaged foods could become contaminated with  
26 microbes present on the fish or packaging. If this ice is then used as a food  
27 ingredient, it could contaminate the final product.

1           **3-303.12     Storage or Display of Food in Contact with Ice and Water.**

2           Packages that are not watertight may allow entry of water that has been  
3           exposed to unsanitary exterior surfaces of packaging, causing the food to be  
4           contaminated. This may also result in the addition of water to the food that  
5           is unclaimed in the food's formulation and label.

6           Unpackaged foods such as fresh fish are often stored and/or displayed on  
7           ice. A potential for increasing the microbial load of a food exists  
8           because, as the ice melts, pathogens from one food may be carried by  
9           water to other foods. The potential for contamination is reduced by  
10          continuous draining of melting ice.

11          ***Preventing*           3-304.11 Food Contact with Equipment and Utensils.\***

12          ***Contamination***

13          ***From Equipment,***

14          ***Utensils, and***

15          ***Linens***

16          Pathogens can be transferred to food from utensils that have been stored  
17          on surfaces which have not been cleaned and sanitized. They may also be  
18          passed on by consumers or employees directly, or indirectly from used  
19          tableware or food containers.

20          Some pathogenic microorganisms survive outside the body for considerable  
21          periods of time. Food that comes into contact directly or indirectly with  
22          surfaces that are not clean and sanitized is liable to such contamination.  
23          The handles of utensils, even if manipulated with gloved hands, are  
24          particularly susceptible to contamination.

25          Probe-type price or identification tags are defined as a utensil. This means  
26          that if such tags are for multiuse, they must meet the criteria listed in  
27          Parts 4-1 Materials for Construction and Repair, and 4-2 Design and  
28          Construction. Probe-type price or product identification tags can cause  
29          microbial, chemical, or physical contamination if not properly designed,  
30          constructed, and maintained.

1 The Food Code defines gloves as a “utensil” and therefore gloves must  
2 meet the applicable requirements related to utensil construction, cleaning, and  
3 storage.

4 **3-304.12 In-Use Utensils, Between-Use Storage.**

5 Refer to the public health reason for § 3-304.11.

6 Once a food employee begins to use a utensil such as a ladle, spatula, or  
7 knife, that has been previously cleaned and sanitized, it is then considered  
8 an in-use utensil. In-use utensils, used on a continuous or intermittent basis  
9 during preparation or dispensing, must be cleaned and sanitized on a  
10 schedule that precludes the growth of pathogens that may have been  
11 introduced onto utensil surfaces. In-use utensils may be safely stored in hot  
12 water maintained at 135°F or above during intermittent use because microbial  
13 growth is controlled at such temperatures.

14 A food utensil should be designed and used to prevent bare hand contact  
15 with ready-to-eat food or to minimize contact with food that is not in a ready-  
16 to-eat form. On-site evaluations can be made to determine if a utensil is  
17 improperly designed for the task or whether a food employee is misusing an  
18 appropriately designed utensil.

19 **3-304.13 Linens and Napkins, Use Limitation.**

20 Because of their absorbency, linens and napkins used as liners that contact  
21 food must be replaced whenever the container is refilled. Failure to replace  
22 such liners could cause the linens or napkins to become fomites.

23 **3-304.14 Wiping Cloths, Use Limitation.**

24 Soiled wiping cloths, especially when moist, can become breeding grounds for  
25 pathogens that could be transferred to food. Any wiping cloths that are not  
26 dry (except those used once and then laundered) must be stored in a  
27 sanitizer solution at all times, with the proper sanitizer concentration in the  
28 solution. Wiping cloths soiled with organic material can overcome the  
29 effectiveness of, and neutralize, the sanitizer. The sanitizing solution must be  
30 changed as needed to minimize the accumulation of organic material and

1 sustain proper concentration. Proper sanitizer concentration should be  
2 ensured by checking the solution periodically with an appropriate chemical  
3 test kit.

#### 4 **3-304.15 Gloves, Use Limitation.**

5 Refer to the public health reason for § 3-304.11.

6 Gloves used in touching ready-to-eat food are defined as a “utensil” and  
7 must meet the applicable requirements related to utensil construction, good  
8 repair, cleaning, and storage.

9 Multiuse gloves, especially when used repeatedly and soiled, can become  
10 breeding grounds for pathogens that could be transferred to food. Soiled  
11 gloves can directly contaminate food if stored with ready-to-eat food or may  
12 indirectly contaminate food if stored with articles that will be used in contact  
13 with food. Multiuse gloves must be washed, rinsed, and sanitized between  
14 activities that contaminate the gloves. Hands must be washed before donning  
15 gloves. Gloves must be discarded when soil or other contaminants enter the  
16 inside of the glove.

17 Slash-resistant gloves are not easily cleaned and sanitized. Their use with  
18 ready-to-eat foods could contaminate the food.

#### 19 **Natural Rubber Latex (NRL) Gloves**

20 Natural rubber latex gloves have been reported to cause allergic reactions in  
21 some individuals who wear latex gloves during food preparation, and even in  
22 individuals eating food prepared by food employees wearing latex gloves  
23 (refer to Annex 2, 3-304.15 of the 2005 Model Food Code). This information  
24 should be taken into consideration when deciding whether single-use gloves  
25 made of latex will be used during food preparation.

26 Although many allergic reactions occur as a result of occupational exposure,  
27 CFSAN is actively reviewing its current policy on the use of disposable NRL  
28 gloves in food operations in light of the possible transmission of the latex  
29 protein via food. To gain additional information regarding allergic reactions  
30 allegedly due to the ingestion of food contaminated by NRL in retail settings,

1 CFSAN has been collecting reports of such reactions from consumers who have  
2 contacted the Agency. Several offices within CFSAN will continue to  
3 collaborate in reviewing incoming data. The results of these activities and  
4 other related efforts will be used to determine if policy changes regarding  
5 the use of latex in food operations, based on food safety considerations, are  
6 warranted.

7 The FDA, Office of Food Additive Safety, Division of Food Contact  
8 Notification, reviews gloves submitted for food-contact use in the food  
9 industry on the basis of the glove's formulation or components. FDA  
10 regulates NRL gloves used for medical purposes only.

11 FDA is aware of the following information related to occupational hazards (  
12 not food safety hazards) associated with the use of NRL gloves:

- 13 • The National Institute for Occupational Safety and Health (NIOSH) published  
14 a 1997 Alert titled "Preventing Allergic Reactions to Natural Rubber Latex in  
15 the Workplace" (NIOSH publication number 97-135) which is found at  
16 <http://www.cdc.gov/niosh/latexalt.html>.
- 17 • The American College of Allergy, Asthma and Immunology (ACAAI) and  
18 the American Academy of Allergy Asthma and Immunology (AAAAI) issued a  
19 joint statement discouraging the routine use of NRL gloves by food handlers.  
20 (1997) <http://www.acaal.org/public/physicians/joint.htm>.

21 The AAAAI provides information on latex allergies on the web at  
22 [http://www.aaaai.org/patients/resources/fastfacts/latex\\_allergy.stm](http://www.aaaai.org/patients/resources/fastfacts/latex_allergy.stm).

23 The ACAAI provides information on latex allergies on the web at  
24 <http://www.acaai.org/public/facts/latex.htm>.

- 25 • An OSHA Technical Information Bulletin recommends reducing allergy  
26 potential by reducing unnecessary exposure to NRL. Stating "Food service  
27 workers ... do not need to use NRL gloves for food handling..." (1999)  
28 [http://www.osha.gov/dts/tib/tib\\_data/tib19990412.html](http://www.osha.gov/dts/tib/tib_data/tib19990412.html).

29 OSHA addresses gloves in the following Federal regulation, which can  
30 be found at:

1 [http://www.osha.gov/pls/oshaweb/owadisp.show\\_document?p\\_table=STANDARDS&p\\_id=9788](http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=STANDARDS&p_id=9788)

3 OSHA Regulations (Standards - 29 CFR)

4 Standard Number: 1910.138

5 Standard Title: Hand Protection.

6 SubPart Number: I

7 SubPart Title: Personal Protective Equipment

8 (a) General requirements. Employers shall select and require employees to  
9 use appropriate hand protection when employees' hands are exposed to hazards  
10 such as those from skin absorption of harmful substances; severe cuts or  
11 lacerations; severe abrasions; punctures; chemical burns; thermal burns; and  
12 harmful temperature extremes.

13 (b) Selection. Employers shall base the selection of the appropriate hand  
14 protection on an evaluation of the performance characteristics of the hand  
15 protection relative to the task(s) to be performed, conditions present, duration  
16 of use, and the hazards and potential hazards identified.

17 **3-304.16 Using Clean Tableware for Second**  
18 **Portions and Refills.**

19 Refer to the public health reason for § 3-304.11.

20 **3-304.17 Refilling Returnables.**

21 Refer to the public health reason for § 3-304.11.

22 ***Preventing* 3-305.11 Food Storage.**

23 ***Contamination* 3-305.12 Food Storage, Prohibited Areas.**

24 ***from the***

25 ***Premises***

26 Pathogens can contaminate and/or grow in food that is not stored properly.  
27 Drips of condensate and drafts of unfiltered air can be sources of microbial  
28 contamination for stored food. Shoes carry contamination onto the floors of  
29 food preparation and storage areas. Even trace amounts of refuse or wastes  
30 in rooms used as toilets or for dressing, storing garbage or implements, or

1 housing machinery can become sources of food contamination. Moist  
2 conditions in storage areas promote microbial growth.

3 **3-305.13 Vended Potentially Hazardous Food (Time/Temperature**  
4 **Control for Safety Food), Original Container.**

5 The possibility of product contamination increases whenever food is  
6 exposed. Changing the container(s) for machine vended potentially hazardous  
7 food (time/temperature control for safety food) allows microbes that may be  
8 present an opportunity to contaminate the food. Pathogens could be present  
9 on the hands of the individual packaging the food, the equipment used, or  
10 the exterior of the original packaging. In addition, many potentially  
11 hazardous foods (time/temperature control for safety foods) are vended in a  
12 hermetically sealed state to ensure product safety. Once the original seal is  
13 broken, the food is vulnerable to contamination.

14 **3-305.14 Food Preparation.**

15 Food preparation activities may expose food to an environment that may  
16 lead to the food's contamination. Just as food must be protected during  
17 storage, it must also be protected during preparation. Sources of  
18 environmental contamination may include splash from cleaning operations,  
19 drips from overhead air conditioning vents, or air from an uncontrolled  
20 atmosphere such as may be encountered when preparing food in a building  
21 that is not constructed according to Food Code requirements.

22 ***Preventing* 3-306.11 Food Display.**  
23 ***Contamination***  
24 ***by Consumers***

25 During display, food can be contaminated even when there is no direct hand  
26 contact. Many microbes can be conveyed considerable distances on air  
27 currents through fine sprays or aerosols. These may originate from people  
28 breathing or sneezing, water sprays directed at drains, or condensate from air  
29 conditioners. Even wind gusts across sewage deposits and fertilized fields

1 have been known to contaminate food in adjacent establishments where food  
2 was unprotected.

3 **3-306.12 Condiments, Protection.**

4 Unpackaged condiments are exposed to contamination by consumers who  
5 could be suffering from a disease transmissible through food. Once the  
6 condiments are contaminated, subsequent consumers using the condiments may  
7 be exposed to pathogens. Condiments in individual packages are protected  
8 from consumer contamination.

9 On- or off-site facilities for refilling condiment dispensers must be adequately  
10 equipped to ensure that the filling operation does not introduce contaminants.

11 **3-306.13 Consumer Self-Service Operations.\***

12 Raw foods of animal origin usually contain pathogens. In addition, these  
13 foods, if offered for consumer self-service, could cross contaminate other  
14 foods stored in the same display. Because raw foods of animal origin are  
15 assumed to be contaminated and do provide an ideal medium for the growth of  
16 pathogenic organisms, they should not be available for consumer self-service.  
17 Self-service operations of ready-to-eat foods also provide an opportunity for  
18 contamination by consumers. The risk of contamination can be reduced by  
19 supplying clean utensils and dispensers and by employee monitoring of  
20 these operations to ensure that the utensils and dispensers are properly  
21 used.

22 Bean sprouts that are displayed in produce areas for consumer self-service  
23 are potentially hazardous foods (time/temperature control for safety foods) and  
24 appropriate refrigeration must be maintained. However, they are not  
25 considered ready-to-eat since they are intended to be washed by the consumer  
26 before consumption.

27 **3-306.14 Returned Food and Re-Service or Sale.\***

28 Food can serve as a means of person-to-person transmission of disease  
29 agents such as hepatitis A virus. Any unpackaged foods, even bakery  
30 goods in a bread basket that are not potentially hazardous (time/temperature

1 control safety foods) and that have been served to a consumer, but not  
2 eaten, can become vehicles for transmitting pathogenic microorganisms from the  
3 initial consumer to the next if the food is served again.

4 ***Preventing* 3-307.11 Miscellaneous Sources of Contamination.**  
5 ***Contamination***  
6 ***from Other***  
7 ***Sources***

8 This Code section provides a category in which to capture sources of  
9 contamination not specifically delineated in Subparts 3-301 through 306.  
10 Codes prior to 1993 had such a provision for addressing food contamination  
11 for reasons other than those elsewhere specified. Regardless of its  
12 specificity, a Code can not anticipate all the diverse means by which food  
13 can become contaminated after receipt.

14 ***Cooking* 3-401.11 Raw Animal Foods.\***  
15 **3-401.12 Microwave Cooking.\***  
16 **3-401.13 Plant Food Cooking for Hot Holding.**

17 Cooking, to be effective in eliminating pathogens, must be adjusted to a  
18 number of factors. These include the anticipated level of pathogenic bacteria  
19 in the raw product, the initial temperature of the food, and the food's bulk  
20 which affects the time to achieve the needed internal product temperature.  
21 Other factors to be considered include post-cooking heat rise and the time  
22 the food must be held at a specified internal temperature.

23 Greater numbers and varieties of pathogens generally are found on poultry  
24 than on other raw animal foods. Therefore, a higher temperature, in  
25 combination with the appropriate time is needed to cook these products.

26 To kill microorganisms, food must be held at a sufficient temperature for  
27 the specified time. Cooking is a scheduled process in which each of a  
28 series of continuous time/temperature combinations can be equally effective.  
29 For example, in cooking a beef roast, the microbial lethality achieved at 112  
30 minutes after it has reached 54.4°C (130°F) is the same lethality attained as

1 if it were cooked for 4 minutes after it has reached 62.8°C (145°F). Cooked  
2 beef and roast beef, including sectioned and formed roasts, chunked and  
3 formed roasts, lamb roasts and cooked corned beef can be prepared using  
4 one of the time and temperature combinations listed in the chart in  
5 § 3-401.11 to meet a 6.5-log<sub>10</sub> reduction of Salmonella. The stated temperature  
6 is the minimum that must be achieved and maintained in all parts of each  
7 piece of meat for a least the stated time. The source of the time and  
8 temperature parameters is from the USDA/FSIS Appendix A. Compliance  
9 Guidelines For Meeting Lethality Performance Standards For Certain Meat And  
10 Poultry Products found at <http://www.fsis.usda.gov/oa/fr/95033F-a.htm>.  
11 Cooking requirements are based in part on the biology of pathogens. The  
12 thermal destruction of a microorganism is determined by its ability to survive  
13 heat. Different species of microorganisms have different susceptibilities to  
14 heat. Also, the growing stage of a species (such as the vegetative cell of  
15 bacteria, the trophozoite of protozoa, or the larval form of worms) is less  
16 resistant than the same organism's survival form (the bacterial spore,  
17 protozoan cyst, or worm egg).  
18 Food characteristics also affect the lethality of cooking temperatures. Heat  
19 penetrates into different foods at different rates. High fat content in food  
20 reduces the effective lethality of heat. High humidity within the cooking  
21 vessel and the moisture content of food aid thermal destruction.  
22 Heating a large roast too quickly with a high oven temperature may char or  
23 dry the outside, creating a layer of insulation that shields the inside from  
24 efficient heat penetration. To kill all pathogens in food, cooking must bring *all*  
25 parts of the food up to the required temperatures for the correct length of  
26 time.  
27 The temperature and time combination criteria specified in Part 3-4 of this  
28 Code are based on the destruction of *Salmonellae*. This organism, if present  
29 in raw shell eggs, is generally found in relatively low numbers. Other foods,  
30 uncomminuted fish and meats including commercially raised game animal

1 meat, specified as acceptable for cooking at this temperature and time  
2 parameter are expected to have a low level of internal contamination. The  
3 parameters are expected to provide destruction of the surface contaminants  
4 on these foods. Part 3-4 includes temperature and time parameters that  
5 provide “D” values (decimal log reduction values) that may surpass 7D. For  
6 example, at 63°C (145°F), a time span of 15 seconds will provide a 3D  
7 reduction of **Salmonella Enteritidis** in eggs.

8 The requirements specified under ¶ 3-401.11(D) acknowledge the rights of an  
9 informed consumer to order and consume foods as preferred by that  
10 consumer based on the consumer’s health status and understanding of the  
11 risks associated with eating raw or partially-cooked animal foods.

12 In consumer self-service operations, such as buffets, salad bars, sushi bars, or  
13 display cases, the consumer advisory as specified under section 3-603.11  
14 must be posted or available at the self-service unit where the raw or  
15 partially cooked food is held for service and readily accessible to consumers  
16 prior to making their food selections. In a catered situation, such as a  
17 wedding reception, guests are responsible for making their own requests or  
18 selections.

### 19 **Slow-cooked roasts - Heating Deviations and Slow Come Up Time**

20 (Source: USDA/FSIS Appendix A Compliance Guidelines For Meeting Lethality  
21 Performance Standards For Certain Meat And Poultry Products found at  
22 <http://www.fsis.usda.gov/oa/fr/95033F-a.htm>

23 Heating deviations, which most often involve slow come-up time or an  
24 inordinate dwell time within the optimum temperature range for microorganism  
25 growth can foster the multiplication of many pathogens. This multiplication  
26 sometimes can be so prodigious that even re-cooking may be ineffective in  
27 rendering the product safe. Also, certain toxigenic bacteria can release  
28 toxins into the product. Some of these toxins, such as those of  
29 **Staphylococcus aureus**, are extremely heat stable and are not inactivated  
30 by normal re-cooking temperatures.

1 Further, the sampling of product following a heating deviation may not yield  
2 sufficient information to determine the safety of the product in question.  
3 Heating deviations can favor the multiplication of many types of bacteria. It  
4 would be difficult and expensive to sample for all of them. Depending on  
5 the circumstances, establishments may want to use computer modeling to  
6 estimate the relative multiplication of bacteria. For example, in a past  
7 incident involving an extreme heating deviation, product was put in an oven  
8 in which the temperature was inadvertently set to 95°F for about 12 hours.  
9 Computer modeling was easily applied in this case because much of the  
10 dwell time was at one temperature. The USDA/FSIS determined that within a  
11 6-hour time frame (with other growth conditions assumed to be favorable), the  
12 relative multiplication of many pathogens of concern could have exceeded  
13 5-logs. Clearly the product could not be salvaged by reprocessing and  
14 was therefore destroyed. Under changing conditions of temperature,  
15 however, computer modeling becomes more difficult. One approach is to  
16 average lag/log times over small increments such as 5° and add these  
17 times to get an approximation of possible total relative growth over a  
18 larger increment of time. Establishments must keep in mind that the  
19 population of bacteria before processing is generally unknown and that  
20 assumptions in the high range often are used as input parameters in the  
21 modeling.

## 22 **Seared Steak**

23 The provision for allowing seared steaks was reviewed by the National  
24 Advisory Committee for Microbiological Criteria for Foods (NACMCF) and  
25 USDA. Paragraph 3-401.11(C) includes their recommendations.

26 USDA comments included, “For the purposes of this discussion, steak is  
27 a whole beef muscle. It does not include whole beef muscle that has  
28 been pinned, injected, or chopped and formed. It may be cut cross grain,  
29 such as sirloin, chuck, or porterhouse; or it may be cut with the grain, such

1 as flank, skirt, or Chateaubriand. Other species, such as poultry, pork, and  
2 lamb are not included.”

3 NACMCF comments included, “Due to the low probability of pathogenic  
4 organisms being present in or migrating from the external surface to the  
5 interior of beef muscle, cuts of intact muscle (steaks) should be safe if the  
6 external surfaces are exposed to temperatures sufficient to effect a cooked  
7 color change. In addition, the cut (exposed) surfaces must receive  
8 additional heat to effect a complete sear across the cut surfaces. Grill or  
9 char marks may be applied to the complete surface searing. The meat  
10 should be seared on both top and bottom surfaces utilizing a heating  
11 environment (e.g., grill or broiling oven) that imparts a temperature at the  
12 surface of the intact steak of at least 145°F to achieve a cooked color  
13 change on all external surfaces. The searing of all surfaces should be  
14 continuous until the desired degree of doneness and appearance are  
15 attained. This is considered a ready-to-eat food.”

16 As reflected in the definition of “whole-muscle, intact beef steak,” marination  
17 is a food safety concern when the fascia (exterior surface) of the steak is  
18 broken by scoring or other means which allows the marinade to penetrate, and  
19 potentially contaminate, the interior of the steak. In such cases, the Code  
20 allowance for undercooking without a consumer advisory is negated.

## 21 **Pork**

22 In pork, *Trichinella spiralis*, *Toxoplasma gondii*, and *Taenia solium*,  
23 parasites causing foodborne illness, are inactivated at temperatures below  
24 145°F. Therefore, pork roasts can be cooked like beef roasts (e.g., 145°F  
25 for 3 minutes) and pork chops cooked like steaks to achieve an internal  
26 temperature of 145°F for 15 seconds.

27 Based on the Goodfellow and Brown study, a 5D reduction of organisms is  
28 achieved at 68°C (155°F) for 15 seconds for the following foods: ratites and  
29 injected meats and comminuted: fish, meat, game animals commercially  
30 raised for food, and game animals that come under a USDA voluntary

1 inspection program. Ratites such as ostrich, emu, and rhea are included in  
2 this list of raw animals foods because when cooked to a temperature greater  
3 than 68°C (155°F), ratites exhibit a (metallic) “off” taste.

4 When USDA established the time and temperature parameters for 9  
5 CFR 318.23 Heat-Processing and Stabilization Requirements for Uncured Meat  
6 Patties (known as the “patty rule”), the Agency based the 5D for Salmonella  
7 on extrapolations applied to the research done by Goodfellow and Brown to  
8 account for the lack of a “come up, come down” time in the thin, small  
9 mass beef patties. Consequently, there is no linear relationship between the  
10 patty rule and roast beef time and temperature parameters. The patty rule  
11 also provided for an 8D reduction in the number of Shiga toxin-producing  
12 *Escherichia coli*. The time and temperature requirements in the Food Code  
13 for comminuted meats are comparable to the USDA requirements.

#### 14 **Temperature for Comminuted Meat at Less Than 1 Second**

15 In the “Report of the Task Force on Technical Issues Arising from the  
16 National Advisory Committee for Microbiological Criteria for Foods (NACMCF)  
17 Review of the Meat Patty Proposal” (undated), it is stated on page 7, in  
18 Option (A), that:

19 “Based on the 1998 research data ... and an assumption that  
20 instantaneous is defined as eight seconds, manufacturers would  
21 be required to process fully-cooked meat patties at a  
22 temperature of 157°F. Given the lack of any significant margin of  
23 safety in this process, there should be no deviation below the  
24 158°F requirement.”

25 In November, 1997, the NACMCF Meat and Poultry Subcommittee revisited the time  
26 and temperatures for cooking hamburger and advised FDA that cooking hamburger  
27 to 158°F for less than one second is an adequate cook based on the following:  
28

- 1 1. The cooking recommendations contained in the Food  
2 Code and in USDA guidance provide a large margin of  
3 safety for killing vegetative enteric pathogens;
- 4 2. The concept of integrated lethality (the kill imparted during  
5 the entire heating and cooling process) adds to the  
6 margin of safety; and
- 7 3. The time component of the time and temperature requirement  
8 will be exceeded before the temperature can be  
9 determined.

10 The parameters for cooking poultry, wild game animal meats, stuffed food  
11 products, etc., of 74°C (165°F) or above for 15 seconds yield greater than a  
12 7D reduction.

### 13 **3-401.12 Microwave Cooking.\***

14 The rapid increase in food temperature resulting from microwave heating  
15 does not provide the same cumulative time and temperature relationship  
16 necessary for the destruction of microorganisms as do conventional cooking  
17 methods. In order to achieve comparable lethality, the food must attain a  
18 temperature of 74°C (165°F) in all parts of the food. Since cold spots may  
19 exist in food cooking in a microwave oven, it is critical to measure the food  
20 temperature at multiple sites when the food is removed from the oven and  
21 then allow the food to stand covered for two minutes post microwave heating  
22 to allow thermal equalization and exposure. Although some microwave  
23 ovens are designed and engineered to deliver energy more evenly to the  
24 food than others, the important factor is to measure and ensure that the final  
25 temperature reaches 74°C (165°F) throughout the food.

26 “The factors that influence microwave thermal processes include many of the  
27 same factors that are important in conventional processes (mass of objects,  
28 shape of objects, specific heat and thermal conductivity, etc.). However,  
29 other factors are unique in affecting microwave heating, due to the nature of  
30 the electric field involved in causing molecular friction. These factors are

1 exemplified by moisture and salt contents of foods, which play a far more  
2 important role in microwave than conventional heating.” (Reference:  
3 Heddelson and Doores, see 2005 Model Food Code Annex 2)

4 **3-401.13 Plant Food Cooking for Hot Holding.**

5 Fruits and vegetables that are fresh, frozen, or canned and that are heated  
6 for hot holding need only to be cooked to the temperature required for hot  
7 holding. These foods do not require the same level of microorganism  
8 destruction as do raw animal foods since these fruits and vegetables are  
9 ready-to-eat at any temperature. Cooking to the hot holding temperature of  
10 57°C (135°F) prevents the growth of pathogenic bacteria that may be present  
11 in or on these foods. In fact, the level of bacteria will be reduced over time at  
12 the specified hot holding temperature.

13 *Freezing* **3-402.11 Parasite Destruction.\***

14 Refer to the public health reason for § 3-201.11.

15 Lightly cooked, raw, raw-marinated, and cold-smoked fish may be desired by  
16 consumers for taste or perceived nutritional reasons. In order to ensure  
17 destruction of parasites, fish may be frozen before service as an alternative  
18 public health control to that which is provided by adequate cooking. Candling  
19 or other visual inspection techniques are not adequate to avoid the risk of  
20 parasites from fish which have not been frozen.

21 The recommended control strategies refer to the ambient air temperature  
22 during freezing and to the length of time that the fish is held at the appropriate  
23 freezer temperature, or the length of time that the fish is held after it is solid  
24 frozen, whichever is appropriate. The parasite hazard is not considered to be  
25 reasonably likely to occur if the finished product is fish eggs that have been  
26 removed from the skein (the tissue that contains the egg mass) and rinsed.  
27 In response to information provided to the FDA Office of Seafood, the [Fish  
28 and Fisheries Products Hazards and Controls Guidance](#) lists certain species of  
29 tuna as not being susceptible to parasites of concern and therefore

1 exempted from the freezing requirements that apply to other fish species  
2 that are consumed raw.

3 The [Fish and Fisheries Products Hazards and Controls Guidance](#) states that  
4 species that normally have parasites as a result of consuming infected prey,  
5 apparently do not have the same parasite hazard when raised on pelleted  
6 food in an aquaculture operation. On the other hand, aquacultured fish that  
7 are fed processing waste and by-catch fish may have a parasite hazard,  
8 even when wild caught fish of that species do not normally have a parasite  
9 hazard. Feed must not contain any live parasites. For example, the use of  
10 fresh fish meat in feed could transmit such parasites. Only heat treated feed  
11 or feed otherwise produced in a manner that would kill parasite intermediate  
12 stages infective to the aquacultured fish, such as most pelleted feeds,  
13 should be used.

#### 14 **3-402.12 Records, Creation and Retention.**

15 Records must be maintained to verify that the critical limits required for food  
16 safety are being met. Records provide a check for both the operator and  
17 the regulator in determining that monitoring and corrective actions have taken  
18 place.

19 While the Country of Origin Labeling requirements, <http://www.ams.usda.gov/COOL/>  
20 effective Sept. 30, 2004, mandate identification of wild and farm-raised fish and  
21 shellfish, the requirements do not address contents of pelleted feed used in the  
22 aquaculture operation. Documentation must be available in the food  
23 establishment from the source-through-purchase specifications or labeling that  
24 pelleted feed used did not contain fresh fish or plankton. Follow the guidance  
25 provided in The [Fish and Fisheries Products Hazards and Controls Guidance](#)  
26 [Table #3-1 - Potential Vertebrate Species Related Hazards](#) and [Table #3-2 -](#)  
27 [Potential Invertebrate Species Related Hazards](#).

#### 28 **Reheating 3-403.11 Reheating for Hot Holding.\***

29 When food is held, cooled, and reheated in a food establishment, there is an  
30 increased risk from contamination caused by personnel, equipment,

1 procedures, or other factors. If food is held at improper temperatures for  
2 enough time, pathogens have the opportunity to multiply to dangerous numbers.  
3 Proper reheating provides a major degree of assurance that pathogens will be  
4 eliminated. It is especially effective in reducing the numbers of ***Clostridium***  
5 ***perfringens*** that may grow in meat, poultry, or gravy if these products were  
6 improperly cooled. Vegetative cells of ***C. perfringens*** can cause foodborne  
7 illness when they grow to high numbers. Highly resistant ***C. perfringens***  
8 spores will survive cooking and hot holding. If food is abused by being held at  
9 improper holding temperatures or improperly cooled, spores can germinate to  
10 become rapidly multiplying vegetative cells.

11 Although proper reheating will kill most organisms of concern, some toxins  
12 such as that produced by ***Staphylococcus aureus***, cannot be inactivated  
13 through reheating of the food. It is imperative that food contamination be  
14 minimized to avoid this risk.

15 The potential for growth of pathogenic bacteria is greater in reheated cooked  
16 foods than in raw foods. This is because spoilage bacteria, which inhibit the  
17 growth of pathogens by competition on raw product, are killed during cooking.  
18 Subsequent recontamination will allow pathogens to grow without competition if  
19 temperature abuse occurs.

20 Refer also to the public health reason for § 3-401.12.

21 **3-404.11 Treating Juice.**

22 Refer to the public health reason for § 3-801.11.

23 **Temperature and 3-501.11 Frozen Food.**

1 If the cooking step prior to cooling is adequate and no recontamination  
2 occurs, all but the spore-forming organisms such as ***Clostridium***  
3 ***perfringens*** or ***Bacillus cereus*** should be killed or inactivated. However,  
4 under substandard sanitary conditions, other pathogens such as ***Salmonella***  
5 or ***Listeria monocytogenes*** may be reintroduced. Thus, cooling  
6 requirements are based on growth characteristics of organisms that may  
7 survive or be a post-cook contaminate and grow rapidly under temperature  
8 abuse conditions.

### 9 **Shell Eggs**

10 FDA has approved the use of ionizing radiation for shell eggs. This  
11 approval means that FDA has not found the ionizing radiation process to be  
12 unsafe for shell eggs. However, shell eggs that have been subjected to the  
13 approved ionizing radiation process are not considered to have been  
14 pasteurized. Shell egg pasteurization requires the egg to have been  
15 subjected to a 5-log kill process for ***Salmonella Enteritidis***, while the  
16 approved ionizing radiation process may deliver only 2 or 3 logs reduction.  
17 Therefore, eggs treated by ionizing radiation process alone must be held  
18 under refrigeration, as it cannot be guaranteed that ***Salmonella Enteritidis***  
19 will be eliminated in all treated eggs. Further, irradiated eggs must be  
20 labeled in accordance with 21 CFR 179.26 Ionizing radiation for the treatment  
21 of food.

22 Hard-boiled eggs with shell intact may be cooled in ambient air and are not  
23 considered to be a potentially hazardous food (time/temperature control for  
24 safety food) after cooling. Hard-boiled eggs may be cooled in drinking water  
25 but are considered to be a potentially hazardous food (time/temperature  
26 control for safety food) after cooling because pathogens, which may be  
27 present in the water, may pass through the egg shell during cooling.

28 ***Salmonella Enteritidis*** has been shown to have an extended lag phase in  
29 shell eggs due to inhibitory characteristics of the albumen. Research  
30 indicates that the organisms are physically located near the exterior of the

1 yolk membrane, in contact with the bacteriostatic components. Growth does  
2 not appear until the yolk membrane is weakened by age or physically  
3 breached and the yolk nutrients, such as iron, become available to the  
4 organisms.

5 Federal regulations effective August 27, 1999, require shell eggs to be  
6 transported and distributed under refrigeration at an ambient temperature not  
7 to exceed 45°F. Packed shell eggs must be labeled indicating that  
8 refrigeration is required. Imported shell eggs packed for consumer use are  
9 required to include a certification that the eggs, at all times after packing,  
10 have been stored and transported at an ambient temperature of no greater  
11 than 45°F.

12 On December 5, 2000, federal regulations were amended to require that  
13 shell egg cartons bear safe handling instructions and be placed under  
14 refrigeration at 45° F or lower upon delivery at retail establishments (65 FR  
15 76091, December 5, 2000, Food Labeling, Safe Handling Statements,  
16 Labeling of Shell Eggs; Refrigeration of Shell Eggs Held for Retail  
17 Distribution). The amended provisions include:

- 18 • 21 CFR Part 16 Regulatory Hearing before the Food and Drug  
19 Administration, § 16.5. Inapplicability and limited applicability, (4)  
20 A hearing on an order for re-labeling, diversion or destruction  
21 of shell eggs...
- 22 • 21 CFR Part 101 Food Labeling § 101.17. Food labeling  
23 warning, notice, and safe handling statements, (h) *Shell eggs*.
- 24 • 21 CFR Part 115 Shell Eggs, § 115.50 Refrigeration of shell  
25 eggs held for retail distribution.

26 Shell eggs must be placed immediately after receipt in refrigerated equipment  
27 that is capable of maintaining an ambient air temperature of 45°F. With  
28 the newly established Federal requirement for eggs to be in an ambient  
29 storage and transportation temperature of 45°F, and with refrigeration of  
30 eggs at retail as described above, the overall time that eggs are stored at

1 temperatures that allow the growth of **Salmonella** spp. should be shortened.  
2 Additionally, this requirement negates the need to “cool” shell eggs upon  
3 receipt, although food establishment operators should maximize the circulation  
4 of cooled air in refrigeration units by separating flats, cases, and multiple  
5 cartons of eggs.

#### 6 **CFSAN/FSIS Joint Position Paper on Cooling**

7 The processing of most ready-to-eat products includes a heat treatment or  
8 cooking step to eliminate pathogenic and spoilage microorganisms. However,  
9 this heat treatment does not eliminate spores of **Clostridium botulinum** and  
10 **Clostridium perfringens** and other spore-forming bacteria. Furthermore, these  
11 organisms can thrive in the warm product since other competing organisms  
12 have been eliminated. Non-refrigerated, anaerobic conditions are conducive  
13 to their growth and multiplication.

14 To prevent the growth and multiplication of spore-forming organisms, product  
15 should be cooled rapidly after cooking. When there is inadequate  
16 cooling, spores can germinate and the resulting vegetative cells can multiply  
17 to hazardous levels. The presence of sufficient numbers of **C. botulinum** or  
18 other spore-forming organisms may lead to production of harmful toxins.  
19 Therefore, ensuring no growth of these organisms will provide the greatest  
20 amount of safety.

21 The USDA/FSIS Performance Standards for the Production of Certain Meat  
22 and Poultry Products require a stabilization step (cooling) after the lethality  
23 step. The stabilization requirements allow for no growth of **C. botulinum**  
24 and no more than 1 log growth of **C. perfringens**. The performance  
25 standard of no more than 1 log growth of **C. perfringens** was based on the  
26 following reasons:

- 27 1. The Centers for Disease Control and Prevention (CDC) suggested viable  
28 counts of  $10^5$  or greater of **C. perfringens** per gram as one of the criteria for  
29 incriminating **C. perfringens** as a causative agent of foodborne illness in  
30 finished product. However, foods responsible for **C. perfringens** outbreaks

1 were found usually to contain  $10^6$  vegetative *C. perfringens* cells per gram.  
2 In FSIS microbiological raw product surveys, samples were found to  
3 contain more than 1000 *C. perfringens* per gram. There is some  
4 probability that greater than  $10^4$  *C. perfringens* per gram can occur in the  
5 raw product on rare occasions. It is a conservative assumption that the  
6 great majority of *C. perfringens* in the raw product are spores.

- 7 2. Heating activates spores that, during cooling, become vegetative cells that  
8 can multiply to hazardous levels. If there are more than  $10^4$  *C.*  
9 *perfringens* (spores) per gram on raw product, it is possible that there  
10 may be more than  $10^4$  vegetative *C. perfringens* per gram in the product  
11 if it is improperly cooled after cooking.
- 12 3. Based on the CDC recommended upper limit of  $10^5$  which should not be  
13 exceeded, it was determined that a limit of no more than 1  $\log_{10}$  growth  
14 of *C. perfringens* would be appropriate to ensure that there would be no  
15 more than  $10^5$  *C. perfringens* per gram on the finished product after  
16 cooling.
- 17 4. The performance standard was discussed with experts on clostridia  
18 research. The experts agreed that limiting the relative growth of *C.*  
19 *perfringens* to no more than 1  $\log_{10}$  would be reasonable and somewhat  
20 conservative with respect to product safety. (64 FR 732, January 6, 1999,  
21 Performance Standards for the Production of Certain Meat and Meat  
22 Products).

23 The FSIS compliance guideline for the cooling performance standards, which  
24 can be found at <http://www.fsis.usda.gov/oa/fr/95033F-b.htm> Compliance  
25 Guidelines for Cooling Heat-Treated Meat and Poultry Products (Stabilization),  
26 is that product must be cooled from 130°F to 80°F in 1.5 hours and from  
27 80°F to 40°F in 5 hours. This cooling rate can be applied universally to  
28 cooked products like partially cooked or fully cooked, intact or non-intact  
29 meat and poultry products. The guideline results in continuous and rapid  
30 cooling of the product in the temperature range where the spore-forming

1 organisms can grow rapidly.

2 The former USDA guideline of cooling from 120°F to 55°F in no more  
3 than 6 hours is also included in the new compliance guidelines. In using  
4 this guideline, chilling should begin within 90 minutes after the cooking cycle  
5 is completed, and cooling should continue until product reaches 40°F. The  
6 6-hour rule begins when the product reaches 120°F, and product should not  
7 be shipped until the product reaches 40°F. This older cooling guideline  
8 results in a significantly smaller margin of safety, especially if the product is  
9 non-intact. In using this older guideline, the establishment has to ensure that  
10 cooling is as rapid as possible, especially between 120°F and 80°F, and  
11 should monitor the cooling closely to prevent any deviation. If product remains  
12 between these temperatures for more than an hour, compliance with the  
13 performance standard is less certain.

14 The FSIS cooling guideline **for meat and poultry products containing 100**  
15 **ppm added nitrite** is 130°F to 80°F in 5 hours and from 80°F to 45°F in 10  
16 hours, a total of 15 hours cooling time. This cooling process provides a  
17 narrow margin of safety. In case of cooling deviations, the establishment  
18 should assume that their process has exceeded the performance standard  
19 for controlling the growth of ***C. perfringens***, and should take corrective  
20 action. However, the **presence of nitrite** should ensure compliance with  
21 the performance standard for ***C. botulinum***.

22 The Food Code provision for cooling is similar, though not identical to  
23 the FSIS cooling compliance guidelines. It provides for cooling from 135°F  
24 to 70°F in 2 hours and from 135°F to 41°F or 45°F in 6 hours and is  
25 based on the same food safety concerns as FSIS" guidance. The Food  
26 Code provides prescriptive cooling time/temperature combinations without a  
27 HACCP plan in place. Federally inspected meat and poultry establishments  
28 are required to implement a HACCP plan for their operations.

29 The Conference for Food Protection (CFP) at its 2000 meeting  
30 recommended that FSIS and FDA ask the National Advisory Committee on

1 Microbiological Criteria for Foods (NACMCF) to review the data on safe  
2 cooling times for cooked, potentially hazardous foods (time/temperature  
3 control for safety foods). The review would include data from a study,  
4 submitted to the CFP, showing that cooling of a meat product from 130°F to  
5 45°F can safely take place in 15 hours based on a study by V.K. Juneja, et  
6 al., 1994. According to the authors of the study, continuous cooling of a  
7 meat product from 130°F to 45°F in 15 hours permitted about 1 log growth  
8 of *C. perfringens*.

9 In response to the CFP recommendation, the FSIS Administrator and CFSAN  
10 agreed that the data referenced in the CFP recommendation do not support  
11 a change in the FSIS guidance or the Food Code § 3-501.14 and  
12 considered it inadvisable to ask the NACMCF to undertake the task  
13 requested for several reasons:

- 14 1. The study did not address growth of *C. botulinum*.
- 15 2. The results are from a carefully controlled laboratory study in which  
16 cooling of the product was steady and continuous, conditions difficult to  
17 maintain in most commercial processing or retail environments even with  
18 data loggers and other control mechanisms in place.
- 19 3. The study was done only on ground beef and may not be applicable to  
20 other meat and poultry or to other potentially hazardous foods  
21 (time/temperature control for safety foods).

22 As an alternative response, CFSAN and FSIS advised CFP that they would  
23 provide this written position paper to clarify their joint position on the  
24 cooling issues.

### 25 **3-501.15 Cooling Methods.**

26 Large food items, such as roasts, turkeys, and large containers of rice or  
27 refried beans, take longer to cool because of the mass and volume from  
28 which heat must be removed. By reducing the volume of the food in an  
29 individual container, the rate of cooling is dramatically increased and  
30 opportunity for pathogen growth is minimized. If the hot food container is

1 tightly covered, the rate of heat transfer is reduced, i.e., the time required  
2 for cooling and the time the food is exposed to optimal temperatures for  
3 bacterial multiplication or toxin production are increased.

4 Alternatives to conventional methods include avoiding the need to cool  
5 larger masses by preparing smaller batches closer to periods of service or  
6 chilling while stirring hot food in containers within an ice water bath.  
7 Commercial refrigeration equipment is designed to hold cold food  
8 temperatures, not cool large masses of food. Rapid chilling equipment is  
9 designed to cool the food to acceptable temperatures quickly by using very  
10 low temperatures and high rates of air circulation.

11 **3-501.16 Potentially Hazardous Food (Time/Temperature**  
12 **Control for Safety Food), Hot and Cold Holding.\***

13 Bacterial growth and/or toxin production can occur if potentially hazardous  
14 food (time/temperature control for safety food) remains in the temperature  
15 “Danger Zone” of 5°C to 57°C (41°F to 135°F) too long. Up to a point, the  
16 rate of growth increases with an increase in temperature within this zone.  
17 Beyond the upper limit of the optimal temperature range for a particular  
18 organism, the rate of growth decreases. Operations requiring heating or  
19 cooling of food should be performed as rapidly as possible to avoid the  
20 possibility of bacterial growth.

21 **Cold Holding**

22 Except for raw shell eggs, control of the growth of *Listeria monocytogenes*  
23 (*Lm*) is the basis for the list of cold holding temperature and time  
24 combinations in paragraph 3-501.17(A). The list addresses time, in  
25 addition to temperature, as a control for the growth of *Lm* in refrigerated,  
26 ready-to-eat, potentially hazardous food (time/temperature control for safety  
27 food). The Code provisions for cold holding focus on environmental  
28 conditions that allow 1 log of growth of *Lm*, and do not set an acceptable  
29 number of *Lm* in food. Neither do they imply that *Lm* is in the product.

30 The times and temperatures in the 1999 Food Code were based on the

1 USDA Pathogen Modeling Program (PMP), which is conservative in  
2 estimating how soon *Lm* begins to grow and how fast. The PMP was  
3 based largely on observations of microbial growth in broth cultures, but  
4 some observations in specific foods were also included. The PMP allows  
5 for some variation in temperature, pH, and water activity, and gives a  
6 conservative estimate of safe times and temperatures for holding foods. The  
7 1999 Food Code estimated safe times and temperatures that would allow 3  
8 logs of growth, based on the PMP.

9 During 2000, CFSAN researched published literature and compiled a listing  
10 of the growth potential of *Lm* in various food commodities using real food  
11 data. Based on this information, the 1999 Food Code times and  
12 temperatures of 41°F for 7 days and 45°F for 4 days were validated, but  
13 the underlying performance standard changed for the commodities studied.  
14 The research-based, food-specific times and temperatures allow no more  
15 than 1 log of growth instead of the 3 log growth predicted in the PMP.  
16 This more stringent performance standard of 1 log is consistent with the  
17 USDA/FSIS performance standard and the fact that the infectious dose of  
18 *Lm* remains unknown.

19 FDA concluded that the 1999 Code time/temperature criteria hold true and  
20 provide both a greater level of safety and a more realistic basis for  
21 regulatory requirements without compromising public health protection.

22 In October 2003, FDA, in cooperation with the USDA/FSIS and CDC,  
23 released the [Quantitative Assessment of the Relative Risk to Public Health  
24 from Foodborne \*Listeria monocytogenes\* Among Selected Categories of Ready-  
25 to-Eat Foods \(risk assessment\)](#). This initiative included the development of  
26 23 separate risk assessments and analysis of the relative risks of serious  
27 illness and death associated with consumption of 23 categories of ready-to-  
28 eat foods. These categories included: seafood, produce, meats, dairy  
29 products, and deli salads.

30 The risk assessment identified several broad factors that affect consumer

1 exposure to *Lm* at the time of food consumption. Two of these factors,  
 2 refrigerated storage temperature and duration of refrigerated storage before  
 3 consumption, have a direct bearing on cold holding time/temperature  
 4 combinations used in food establishments.

5 FDA continues to have concerns about the potential for growth of *Lm* in  
 6 refrigerated, ready-to-eat, potentially hazardous food (time/temperature control  
 7 for safety food), prepared and packaged in a food processing plant and held  
 8 in a food establishment. Data from the risk assessment (see the following  
 9 Annex 3 3-501.16 Table 1) show a significant reduction in the projected cases  
 10 of listeriosis when refrigerated storage is limited to 41°F. Based on these  
 11 data and conclusions from the risk assessment, FDA continues to  
 12 recommend that food establishments limit the cold storage of potentially  
 13 hazardous (time/temperature control for safety), ready-to-eat foods to a  
 14 maximum temperature of 41°F.

15  
 16 **3-501.16 – Table 1. Estimated Reduction of Cases of Listeriosis from**  
 17 **Limits on Refrigeration Temperatures\***

Maximum Refrigerator Temperature	Cases of Listeriosis <sup>a</sup>		
	Median	5 <sup>th</sup> Percentile	95 <sup>th</sup> Percentile
<b>Baseline<sup>b</sup></b>	2105	3/4 <sup>c</sup>	3/4 <sup>c</sup>
<b>7 °C (45 °F) maximum</b>	656	331	761
<b>5 °C (41 °F) maximum</b>	28	1	126

1  
2           <sup>a</sup>Values for the median, upper and lower uncertainty levels.

3           <sup>b</sup>The baseline uses the full empirical distribution of refrigerator temperatures from the Audits  
4 International (1999) survey.

5           <sup>c</sup>The baseline number of cases of listeriosis is fixed based on CDC surveillance data.

6           \*The scenario assumed the distribution of storage times is the same for all three temperature sets.  
7

8           Source: Quantitative Assessment of the Relative Risk to Public Health from Foodborne *Listeria*  
9 *monocytogenes* Among Selected Categories of Ready-to-Eat Foods September 2003. Table VI-1.  
10           Estimated Reduction of Cases of Listeriosis from Limits on Refrigeration Temperatures.  
11

12           Regarding shell eggs, USDA published a final rule (63 FR 45663, August 27,  
13 1998 Refrigeration and Labeling Requirements for Shell Eggs) to require that  
14 shell eggs packed for consumer use be stored and transported at an ambient  
15 temperature not to exceed 7°C (45°F). This regulation, however, does not apply  
16 to eggs while held at all retail establishments. FDA is concerned that  
17 without continued refrigeration up until the time that the eggs are cooked,  
18 there would be an opportunity for the egg's defenses to degrade and growth of  
19 ***Salmonella Enteritidis*** to occur. The agency reviewed research indicating that  
20 ***Salmonella Enteritidis*** multiplies at temperatures of 10°C (50°F) and above  
21 but can be inhibited at lower temperatures, e.g., 8°C (46°F), 7°C (45°F), and  
22 4°C (39°F). Based on this research and USDA's temperature requirement  
23 during transport, FDA implemented regulations that establish a maximum  
24 ambient air temperature of 7°C (45°F) for eggs stored and displayed at retail  
25 establishments. Amended Federal regulations 21 CFR Part 115.50 issued on  
26 December 5, 2000 and became effective on June 4, 2001.

27           Although Congress did not expressly preempt State law in this area, FDA  
28 found preemption is needed because State and local laws that are less  
29 stringent than the Federal requirements will not support the important public  
30 health goals of these regulations. FDA does not believe that preemption of  
31 State and local refrigeration and labeling requirements that are the same as  
32 or more stringent than the requirements of these regulations is necessary,

1 as enforcement of such State and local requirements will support the food  
2 safety goals of these regulations. Accordingly, the preemptive effect of this  
3 rule is limited to State or local requirements that are not as stringent as the  
4 requirements of these regulations; requirements that are the same as or  
5 more stringent than FDA's requirements remain in effect.

### 6 **Hot Holding**

7 In a January 2001 report, the National Advisory Committee on Microbiological  
8 Criteria for Foods (NACMCF) recommended that the minimum hot holding  
9 temperature specified in the Food Code:

- 10 • Be greater than the upper limit of the range of temperatures at  
11 which *Clostridium perfringens* and *Bacillus cereus* may grow;  
12 and
- 13 • Provide a margin of safety that accounts for variations in food  
14 matrices, variations in temperature throughout a food product,  
15 and the capability of hot holding equipment to consistently  
16 maintain product at a desired target temperature.

17 **C. perfringens** has been reported to grow at temperatures up to 52°C  
18 (126°F). Growth at this upper limit requires anaerobic conditions and follows  
19 a lag phase of at least several hours. The literature shows that lag phase  
20 duration and generation times are shorter at incubation temperatures below  
21 49°C (120°F) than at 52°C (125°F). Studies also suggest that temperatures  
22 that preclude the growth of **C. perfringens** also preclude the growth of **B.**  
23 **cereus**.

24 CDC estimates that approximately 250,000 foodborne illness cases can be  
25 attributed to **C. perfringens** and **B. cereus** each year in the United States.  
26 These spore-forming pathogens have been implicated in foodborne illness  
27 outbreaks associated with foods held at improper temperatures. This  
28 suggests that preventing the growth of these organisms in food by maintaining  
29 adequate hot holding temperatures is an important public health intervention.  
30 Taking into consideration the recommendations of NACMCF and the 2002

1 Conference for Food Protection meeting, FDA believes that maintaining food  
2 at a temperature of 57°C (135°F) or greater during hot holding is sufficient to  
3 prevent the growth of pathogens and is therefore an effective measure in the  
4 prevention of foodborne illness.

5 **3-501.17 Ready-to-Eat, Potentially Hazardous Food**  
6 **(Time/Temperature Control for Safety Food),**  
7 **Date Marking.\***

8 **3-501.18 Ready-to-Eat, Potentially Hazardous Food**  
9 **(Time/Temperature Control for Safety Food),**  
10 **Disposition.\***

11 Refer to Annex 7, Chart 4-C.

12 Refrigeration prevents food from becoming a hazard by significantly slowing the  
13 growth of most microbes. The growth of some bacteria, such as *Listeria*  
14 *monocytogenes*, is significantly slowed but not stopped by refrigeration.  
15 Over a period of time, this and similar organisms may increase their risk to  
16 public health in ready-to-eat foods.

17 The date by which the food must be consumed takes into consideration the  
18 differences in growth of *Listeria monocytogenes* at 5°C (41°F) and 7°C  
19 (45°F). Based on a predictive growth curve modeling program for *Listeria*  
20 *monocytogenes*, ready-to-eat, potentially hazardous food (time/temperature  
21 control for safety food) may be kept at 5°C (41°F) a total of 7 days or at 7°C  
22 (45°F) a total of 4 days. Therefore, the period of time allowed before  
23 consumption is shortened for food in refrigerators incapable of maintaining  
24 food at 5°C (41°F) but capable of maintaining it at 7°C (45°F) or below. Food  
25 which is prepared and held, or prepared, frozen, and thawed must be  
26 controlled by date marking to ensure its safety based on the total amount of  
27 time it was held at refrigeration temperature, and the opportunity for *Listeria*  
28 *monocytogenes* to multiply, before freezing and after thawing. Potentially  
29 hazardous (time/temperature control for safety) refrigerated foods must be  
30 consumed, sold or discarded by the expiration date.

1 Date marking is the mechanism by which the Food Code requires active  
2 managerial control of the temperature and time combinations for cold holding.  
3 Industry must implement a system of identifying the date or day by which the  
4 food must be consumed, sold, or discarded. Date marking requirements  
5 apply to containers of processed food that have been opened and to food  
6 prepared by a food establishment, in both cases if held for more than 24  
7 hours, and while the food is under the control of the food establishment. This  
8 provision applies to both bulk and display containers. It is not the intent of  
9 the Food Code to require date marking on the labels of consumer size  
10 packages.

11 A date marking system may be used which places information on the food,  
12 such as on an overwrap or on the food container, which identifies the first  
13 day of preparation, or alternatively, may identify the last day that the food  
14 may be sold or consumed on the premises. A date marking system may use  
15 calendar dates, days of the week, color-coded marks, or other effective  
16 means, provided the system is disclosed to the Regulatory Authority upon  
17 request, during inspections.

### 18 **FDA/USDA/CDC *Listeria monocytogenes* Risk Assessment**

19 In September, 2003, FDA, in cooperation with USDA/FSIS and CDC,  
20 released the [Quantitative Assessment of the Relative Risk to Public Health from](#)  
21 [Foodborne \*Listeria monocytogenes\* Among Selected Categories of Ready-to-Eat](#)  
22 [Foods](#). This initiative included the development of 23 separate risk  
23 assessments and analysis of the relative risks of serious illness and death  
24 associated with consumption of 23 categories of ready-to-eat foods. These  
25 categories included: seafood, produce, meats, dairy products, and deli  
26 salads.

27 In examining these closely, FDA showed that 5 factors are important in  
28 measuring the public health impact to consumers from foodborne listeriosis.  
29 These factors are: (1) amounts and frequency of consumption of a ready-to-  
30 eat food; (2) frequency and levels of ***L. monocytogenes*** in a ready-to-eat

1 food; (3) potential of the food to support growth of the bacterium during  
2 refrigeration; (4) refrigerated storage temperature; and (5) duration of  
3 refrigerated storage before consumption.

4 Based on these 5 factors, the 23 categories of ready-to-eat foods were  
5 ranked according to their relative risk of contamination and growth of *Listeria*  
6 *monocytogenes*. The risk categories used were: very high risk; high risk;  
7 moderate risk; low risk; and very low risk.

### 8 ***Impact of the Listeria monocytogenes Risk Assessment on Date*** 9 ***Marking***

10 Based on the results of the risk assessment and the recommendations  
11 from the 2004 Conference for Food Protection meeting, it was necessary  
12 to re-evaluate date marking in an effort to focus the provision on very  
13 high and high risk foods, while at the same time, exempting foods that  
14 present a very low, or low risk of contamination and growth of *Listeria*  
15 *monocytogenes*. Based on this evaluation, date marking provisions of  
16 the Food Code do not apply to the following foods:

#### 17 ***Deli Salads Prepared and Packaged in a Food Processing Plant***

18 Examples of deli salads include ham salad, chicken salad, egg salad, seafood  
19 salad, pasta salad, potato salad, and macaroni salad, manufactured  
20 according to 21 CFR 110. According to data from the risk  
21 assessment, deli salads prepared and packaged by a food processing  
22 plant contain sufficient acidity, along with the addition of preservatives (e.g.,  
23 sorbate, benzoates), to prevent the growth of *Listeria monocytogenes*.

24 There are estimates that 85% of all deli salads are prepared and  
25 packaged in a food processing plant and do not support growth. Based  
26 on discussions with deli salad manufacturers and trade associations, it is a  
27 nearly universal practice for food processing plants preparing and packaging  
28 deli salads to add one or more preservatives that inhibit the growth of  
29 *Listeria monocytogenes*. Based on their wide use within this segment of  
30 the industry and their effectiveness at inhibiting the growth of *Listeria*

1            ***monocytogenes***, all deli salads prepared and packaged in a food  
2 processing plant are exempt from date marking. However, all deli  
3 salads prepared in a food establishment require date marking.

4            ***Hard and Semi-Soft Cheeses***

5            In December, 1999, FDA issued an exemption from date marking for  
6 certain types of hard and semi-soft cheeses  
7 (<http://www.cfsan.fda.gov/~ear/ret-chdt.html>), based on the presence of  
8 several factors that may control the growth of ***Listeria monocytogenes***.  
9 These factors may include organic acids, preservatives, competing  
10 microorganisms, pH, water activity, or salt concentration. The results of  
11 the risk assessment support this interpretation and therefore, hard and  
12 semi-soft cheeses each manufactured according to 21 CFR 133 are  
13 exempt from date marking.

1 **List of Some Hard and Semi-Soft Cheeses Exempt from Datemarking**

2	Asadero	Asiago soft
3	Abertam	Battelmatt
4	Appenzeller	Bellelay (blue veined)
5	Asiago medium or old	Blue
6	Bra	Brick
7	Cheddar	Camosum
8	Cristalina	Chantelle
9	Colby	Edam
10	Cotija Anejo	Fontina
11	Cotija	Gorgonzola (blue veined)
12	Coon	Gouda
13	Derby	Havarti
14	Emmentaler	Konigskase
15	English Dairy	Limburger
16	Gex (blue veined)	Milano
17	Gloucester	Manchego
18	Gjetost	Monterey
19	Gruyere	Muenster
20	Herve	Oka
21	Lapland	Port du Salut
22	Lorraine	Provolone
23	Oaxaca	Queso de Bola
24	Parmesan	Queso de la Tierra
25	Pecorino	Robbiole
26	Queso Anejo	Roquefort (blue veined)
27	Queso Chihuahua	Samsoe
28	Queso de Prensa	Tilsiter
29	Romanello	Trappist

- 1 Romano
- 2 Reggiano
- 3 Sapsago
- 4 Sassenage (blue veined)
- 5 Stilton (blue veined)
- 6 Swiss
- 7 Tignard (blue veined)
- 8 Vize
- 9 Wensleydale (blue veined)

10 ***Cultured Dairy Products***

11 Cultured dairy products include yogurt, sour cream, and buttermilk, each  
12 manufactured according to 21 CFR 131. Many of these products often are  
13 low pH foods manufactured with lactic acid fermentation. Data from the risk  
14 assessment show that ***Listeria monocytogenes*** does not grow in these  
15 foods and therefore, these products are exempt from date marking.

16 ***Preserved Fish Products***

17 Preserved fish products include pickled herring and dried, or salted cod,  
18 and other acidified fish products, manufactured according to 21 CFR 114.  
19 Data from the risk assessment show that the high salt and/or acidity of  
20 these products does not allow for the growth of ***Listeria monocytogenes***  
21 and therefore, these products are exempt from date marking. This  
22 exemption does not apply to hot or cold smoked fish products, nor does it  
23 apply to fish products that are dried, marinated, or otherwise preserved on-  
24 site, in a food establishment, such as ceviche.

25 **USDA-regulated products**

26 Date marking provisions of the Food Code do not apply to shelf stable  
27 ready-to-eat meat and poultry products. Shelf stable ready-to-eat meat and  
28 poultry products are not required by USDA to be labeled “Keep  
29 Refrigerated.” For these products, the nitrite and salt in the cure and the  
30 lower pH resulting from fermentation give additional protection against microbial

1 growth. Some fermented sausages and salt-cured products are shelf stable, do  
2 not require refrigeration, and do not bear the label “Keep Refrigerated.” To  
3 be shelf stable, a product manufactured under USDA inspection must have  
4 a process that results in a product that meets one of the recognized  
5 objective criteria for shelf stability, such as water activity, moisture-protein  
6 ratio (MPR), or combination of MPR and pH (acidity). Therefore they are  
7 exempt from the Food Code date marking requirements.

8 Shelf stable fermented sausages such as pepperoni and dry salami do not  
9 have to be refrigerated or date marked. Shelf stable salt-cured products such  
10 as prosciutto, country cured ham, or Parma ham do not require refrigeration or  
11 Food Code date marking. Other salt-cured products include basturma,  
12 breasaola, coppa, and capocollo.

13 Some ready-to-eat fermented sausages and salt-cured products must be  
14 refrigerated and therefore bear the USDA-required label “Keep Refrigerated.”  
15 Examples of these products are cooked bologna, cooked salami, and sliced  
16 country ham which are ready-to-eat fermented products that need  
17 refrigeration. Bologna is a cooked, perishable sausage and there are other  
18 salamis, e.g., cotto that are perishable.

19 Regarding the exemption from date marking for shelf-stable sausages in a  
20 casing, the exemption does not apply if the casing is removed. The intact  
21 casing on shelf-stable sausages may be overwrapped to protect the cut face  
22 of the sausage. With shelf stable (not potentially hazardous (time/temperature  
23 control safety)) sausages, the intact casing provides a barrier to contamination  
24 (although not an absolute one), the exposed face is likely to be sliced again  
25 within 4 or 7 days, and contamination is minimized because only the face is  
26 exposed. The coagulated protein that occurs on the surface of some  
27 nonshelf stable cooked sausages is not a casing.

28 Slices of cured and fermented sausages that require refrigeration and are kept  
29 for 24 hours or longer do need to be date marked.

30 If open dating information is applied to lunchmeats at a federally inspected

1 meat or poultry establishment, the information must comply with the  
2 requirements in 9 CFR 317.8 and 381.129. However, such dating is not  
3 required by USDA/FSIS and if applied, would not supercede or replace date  
4 marking requirements established by the Food Code or by State/local  
5 authorities that apply after the food is opened in a retail establishment.

### 6 **Manufacturer's use-by dates**

7 It is not the intent of this provision to give a product an extended shelf life  
8 beyond that intended by the manufacturer. Manufacturers assign a date to  
9 products for various reasons, and spoilage may or may not occur before  
10 pathogen growth renders the product unsafe. Most, but not all, sell-by or use-  
11 by dates are voluntarily placed on food packages.

12 Although most use-by and sell-by dates are not enforceable by regulators, the  
13 manufacturer's use-by date is its recommendation for using the product while  
14 its quality is at its best. Although it is a guide for quality, it could be based  
15 on food safety reasons. It is recommended that food establishments consider  
16 the manufacturer's information as good guidance to follow to maintain the  
17 quality (taste, smell, and appearance) and salability of the product. If the  
18 product becomes inferior quality-wise due to time in storage, it is possible  
19 that safety concerns are not far behind.

20 It is not the intention of this provision that either the manufacturer's date or  
21 the date marked by the food establishment be placed on consumer  
22 packages.

### 23 **3-501.19 Using Time as a Public Health Control.\***

24 The 2000 Conference for Food Protection (CFP) meeting recommended that FDA  
25 ask the National Advisory Committee on Microbiological Criteria for Foods  
26 (NACMCF) to review the Food Code provision that addresses using time  
27 alone as a public health control, section 3-501.19. In response to the CFP  
28 recommendation, FDA in consultation with USDA/FSIS, determined that there  
29 is sufficient scientific information available to support the current provision in  
30 the Food Code without requesting consideration by the NACMCF. As an

1 alternative response, FDA informed the CFP that it would provide the  
2 following position paper on using time alone as a public health control.

### 3 **Position Paper**

4 Food Code section 3-501.19 allows potentially hazardous food  
5 (time/temperature control for safety) food that is ready-to-eat (RTE) to be  
6 stored without temperature control for up to 4 hours, after which it must be  
7 discarded or consumed or for up to 6 hours for refrigerated food, if the food  
8 is 5°C (41°F) when initially removed from temperature control, and as long as  
9 the food temperature does not exceed 21°C (70°F). The following information is  
10 provided to explain the reasoning in allowing time alone to be used as a  
11 public health control for food safety.

### 12 Background information

13 Food kept without temperature control allows product to warm or cool as it  
14 equilibrates with the environment. Each temperature scenario incurs different  
15 risks in regard to the type of foodborne pathogens able to grow and the rate of  
16 growth likely to occur. For both cooling and warming conditions, growth  
17 depends on the amount of time the food spends in an optimum growth temperature  
18 range during its equilibration with its surroundings. Several factors influence  
19 the rate of temperature change in a food, such as the type of food, thickness  
20 of the food, and temperature differential between the food and its  
21 surroundings. When evaluating the safety of a 4-hour limit for food with no  
22 temperature control, products and environmental parameters must be  
23 selected to create a worst-case scenario for pathogens growth and possible  
24 toxin production.

### 25 **Holding Cold Food Without Temperature Control**

26 When a food is removed from refrigerated storage and begins to warm to  
27 room temperature, *Listeria monocytogenes* is a primary organism of concern.  
28 Even while food is held at refrigeration temperatures, the growth potential of *L.*  
29 *monocytogenes* warrants concern for potentially hazardous (time/temperature  
30 control for safety foods) RTE foods. Although the FDA and USDA have a

1 zero tolerance for *L. monocytogenes* in RTE food, conditions are permitted  
2 in the Food Code that would allow *L. monocytogenes* cells 1 log of growth (3.3  
3 generations). *Salmonella* is also a concern especially with products containing  
4 eggs. However, *L. monocytogenes* grows more rapidly than *Salmonella* at  
5 refrigeration and room temperatures. By ensuring minimal *Listeria* growth in  
6 food, the threat from *Salmonella* would be negligible. Warming conditions will  
7 allow food to remain exposed to temperatures that allow *B. cereus* to  
8 produce emetic toxin. However, the 4-hour time constraint in the Food Code is  
9 sufficient to prevent any toxin formation.

10 For food refrigerated at 41°F or 45°F then transferred to an ambient  
11 temperature of 75°F for 4 hours, the growth rate of *L. monocytogenes* remains  
12 slow enough to ensure that the critical limit of 1 log growth is not reached.  
13 Published generation times at 75°F for *L. monocytogenes* in food were not  
14 found, however published values at 68°F and 70°F in egg and milk products  
15 confirmed slow *L. monocytogenes* growth at room temperatures.

16 Using the USDA Pathogen Modeling Program (PMP) and assuming the optimum  
17 conditions of pH 6.8, 0.5% NaCl, 0.0% nitrite, *L. monocytogenes* would require  
18 more than 4 hours to grow 1 log at 75°F. The PMP is based on broth studies and  
19 not on food products. Therefore, the growth rates reported at various  
20 temperatures by the PMP are faster than growth rates in most food products.  
21 Another factor exaggerating the growth rate in this warming scenario as  
22 predicted by the PMP is the assumption that the food product spent all 4  
23 hours at 75°F. Obviously food equilibrates with the surrounding environment  
24 at a gradual rate and would not equilibrate instantly.

25 Unfortunately there are no models that take changing temperatures into  
26 consideration when predicting growth. Likewise there are very few published  
27 papers dealing with the growth of organisms in food during warming. The  
28 conservative nature of the 4-hour limit for keeping foods without temperature  
29 control allows for a needed margin of safety if the temperature of the  
30 environment is higher than 75°F.

1 It is important to note that potentially hazardous (time/temperature control for  
2 safety) foods held without cold holding temperature control for a period of 4  
3 hours do not have any temperature control or monitoring. These foods can  
4 reach any temperature when held at ambient air temperatures as long as they  
5 are discarded or consumed within the four hours.

### 6 **Holding Hot Food without Temperature Control**

7 The second scenario for food without temperature control exists when food is  
8 cooked according to Food Code recommendations, then kept at room temperature  
9 for 4 hours before discarding. Foodborne pathogens of concern for an  
10 uncontrolled temperature scenario are sporeformers including ***Clostridium***  
11 ***perfringens*** and ***Bacillus cereus***. Food cooked according to Food Code  
12 guidelines should be free of vegetative cells. However, the heat requirements are  
13 not sufficient to kill spores of ***C. perfringens*** or ***B. cereus*** and may actually  
14 serve as a heat shock that activates the spores. ***B. cereus*** is found  
15 commonly in outbreaks attributed to inadequate hot holding of starchy foods  
16 like rice, and has been isolated in a multitude of food products. ***C.***  
17 ***perfringens*** is found commonly in outbreaks attributed to inadequate hot holding  
18 of beef and poultry. Despite the prevalence of both spores in nature, ***C.***  
19 ***perfringens*** cases are estimated to be more numerous than ***B. cereus*** cases by  
20 a factor of 10.

21 ***B. cereus*** can produce emetic toxin in food, and the optimum temperature  
22 for the production of toxin is between 77°F and 86°F. However, the time  
23 needed to produce the toxin is longer than the time the food will be exposed  
24 to any temperature range with a 4-hour holding limit. Both ***C. perfringens*** and  
25 ***B. cereus*** produce enterotoxin inside the intestine of the infected host if  
26 substantial numbers of vegetative cells are present in the food ( $10^{5-7}$  CFU/g).  
27 Although the reported levels of both spores in raw foods vary in the literature,  
28 generally the level expected in food can be assumed to be low (around 10-  
29 1000 CFU/g). This implies that conditions allowing 1 log growth of either  
30 spore could be tolerated in food.

1 During the time without temperature control, the temperature of the food could  
2 decrease slowly enough to expose spores of both organisms to optimal growth  
3 conditions for a significant length of time. Like warming, several variables exist  
4 that determine the rate of heat transfer. Because of the wide variety of foods  
5 prepared it would be impossible to generalize how fast a typical product loses  
6 temperature after cooking. As with warming, it is prudent to imagine a worst-  
7 case scenario where heat loss is slowed. A beef roast slow cooked to 130°F  
8 for the appropriate time according to the Food Code was used as  
9 consideration for possible spore growth. Cooking roast beef to 130°F can  
10 create an anaerobic environment in both the meat and gravy. The low  
11 internal temperature creates a small temperature differential with the  
12 environment (assumed at 75°F), allowing for a slower decrease in the  
13 food's temperature.

14 After evaluating published studies as well as data collected at the FDA, the  
15 surface of a roast beef or rolled meat product would lose heat quickly  
16 enough to discourage significant growth of either ***C. perfringens*** or ***B.***  
17 ***cereus***. If all spores were distributed on the surface of the product by either  
18 pre- or post-cooking contamination, storing this product for 4 hours at room  
19 conditions would be considered safe. Likewise, products that are stirred or  
20 products that lose heat faster than a roast would also be considered safe.  
21 FDA intends to do research regarding food products that may have spores in  
22 the center of the product, and further evaluate if there are potential hazards  
23 that may be associated with them while held without temperature control for  
24 4 hours.

25  
26 ----- End of position paper -----  
27

28 At the 2004 meeting of the CFP, a committee submitted and the  
29 Conference accepted a document that examined scientific research related to  
30 the growth of ***Listeria monocytogenes***, and the influence of time and

1 temperature on its growth. The CFP committee report is found at  
2 [http://www.foodprotect.org/doc/04\\_issues/folder\\_attachments/III-008a%finalreport-](http://www.foodprotect.org/doc/04_issues/folder_attachments/III-008a%finalreport-timeasapublichealthcontrol.pdf)  
3 [timeasapublichealthcontrol.pdf](http://www.foodprotect.org/doc/04_issues/folder_attachments/III-008a%finalreport-timeasapublichealthcontrol.pdf).

4 The 2004 CFP report stated that the USDA-PMP program can be used as  
5 a tool to estimate time periods for a 1-log increase in growth for *Listeria*  
6 *monocytogenes* in ideal (laboratory media) growth conditions. Using this  
7 modeling approach, at 41°F, 45°F, and 50°F, the time for a 1-log increase  
8 was, 87.8, 53.9, and 34.7 hours, respectively. At room temperature (70°F) a 1-  
9 log increase was noted at 5.2 hours and at ideal growth temperatures  
10 (95°F), the reported time for a 1-log increase was 3.0 hours. In general, the  
11 data from the USDA-PMP program provides very conservative growth data  
12 and, in most cases, growth would be expected to be less rapid in a food  
13 system. This table does provide comparative information relative to growth  
14 rates at different holding temperatures in the event that time was used as a  
15 factor in managing food safety.

16 The report further recommended that food could safely be held for up to  
17 6 hours without external temperature control as long as the food  
18 temperature did not exceed 70°F. Based on that report and data from the  
19 Quantitative Assessment of the Relative Risk to Public Health from Foodborne  
20 *Listeria monocytogenes* Among Selected Categories of Ready-to-Eat Foods  
21 September 2003, the Food Code allows potentially hazardous food  
22 (time/temperature control for safety) food to be stored up to 6 hours without  
23 external temperature control provided that the food temperature does not  
24 exceed 70°F and the food is discarded or consumed at the end of the 6  
25 hours.

### 26 **Raw eggs**

27 Recipes in which more than one egg is combined carry an increased risk of  
28 illness and possible serious consequences for certain people. It is due to this  
29 increased risk, and documented occurrences of foodborne illness and death  
30 among highly susceptible populations from temperature-abused raw shell eggs

1 contaminated with **Salmonella Enteritidis**, that the use of time as a public  
2 health control in institutional settings is not allowed.

3 **Specialized 3-502.11 Variance Requirement.\***

4 **Processing**

5 **Methods**

6 Specific food processes that require a variance have historically resulted in  
7 more foodborne illness than standard processes. They present a significant  
8 health risk if not conducted under strict operational procedures. These types  
9 of operations may require the person in charge and food employees to use  
10 specialized equipment and demonstrate specific competencies. The variance  
11 requirement is designed to ensure that the proposed method of operation is  
12 carried out safely.

13 The concept of variances may be new to some regulatory authorities. Some  
14 jurisdictions may not have a formal process to respond to industry requests for  
15 variances, although informal allowances may have been allowed in specific  
16 situations. Recognizing the opportunity to use the variance process may  
17 require additional rulemaking, or at least policy development, at the jurisdictional  
18 level. Rulemaking can be used to outline the procedures for a variance  
19 request, including the information required in section 8-103.11. In addition, the  
20 rulemaking process can address the regulatory authority's responsibility to  
21 consider an industry's variance application and an appeals process in case a  
22 variance is not given due consideration or is denied. The Conference for Food  
23 Protection Variance Committee recommended that regulatory agencies adopt a  
24 variance review process. General guidance regarding administrative  
25 procedures is given below.

26 Regulatory authorities considering implementing variances have encountered  
27 issues relating to their authority or technical, scientific ability to evaluate or  
28 validate a variance request. From any variance request there may emerge a  
29 set of complex issues and scientific competencies beyond the ability of the  
30 regulatory authority to validate. The Conference for Food Protection Variance

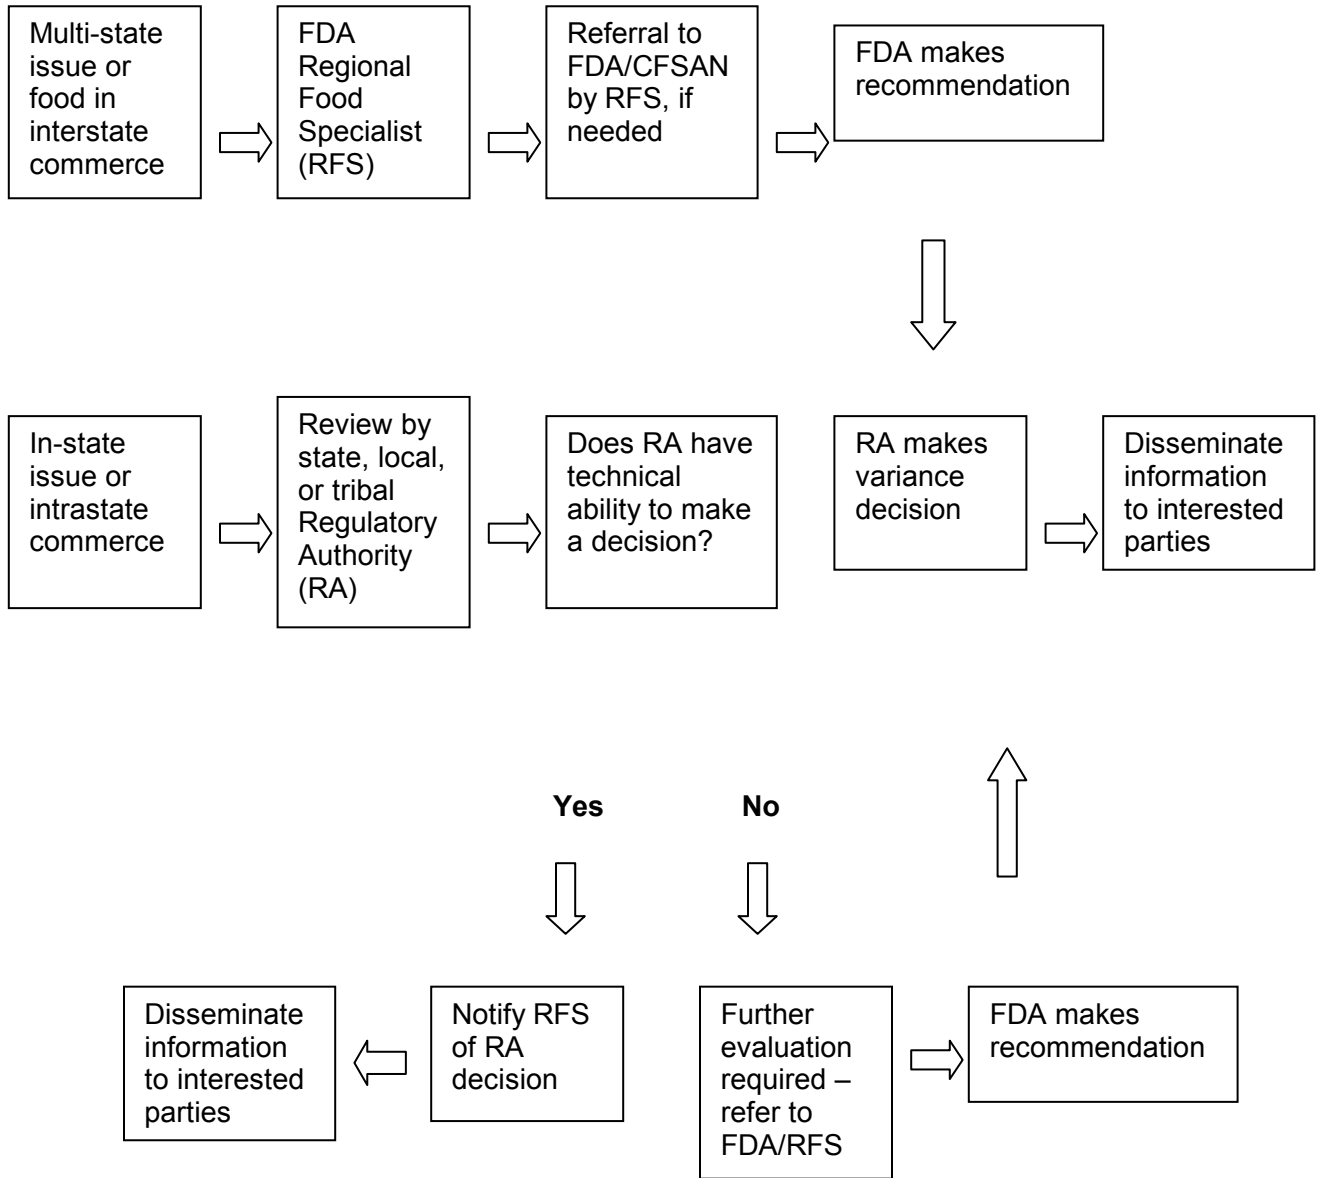

1 Committee recommended that rulemaking should reflect a multi-level matrix of  
2 regulatory agencies ranging from local regulatory authorities through FDA and  
3 reflected that recommendation in the following flow chart. The regulatory  
4 authority is encouraged to seek input and guidance from authoritative  
5 sources such as processing authorities, professional associations, or  
6 academia. Within the Variance Committee's model, the process for seeking FDA  
7 advice begins with the Regional Food Specialists.

8 Except for the Interstate Travel Program, FDA generally does not directly  
9 regulate retail and food service establishments, including entertaining  
10 variances for that segment of the industry. FDA is still exploring processes for  
11 handling variances on a national basis such as those received from national chain  
12 businesses. In conjunction with the 2000 CFP Variance Committee, FDA will  
13 continue to explore ways to provide assistance and guidance to regulators  
14 regarding access to scientific and technical resources in order to make  
15 science-based decisions regarding variances.

16 FDA recommends that regulatory authorities develop a written administrative  
17 process that is consistent with, and addresses the information contained in,  
18 Food Code sections 8-103.10, 8-103.11, and 8-103.12, and follow a process  
19 consistent with the recommendations of the CFP Variance Committee as shown  
20 in its flow chart.

3-501.11 Chart 1 – A Model Flow Process for State Regulators to Address Variances

Developed by the CFP Variance Committee

1  
2 Model Administrative Procedures for Regulators to Address Variances

- 3 1) Designate an agency team and assign a leader to address variance requests.  
4  
5 2) Establish an agency review process leading to approval or denial of variance  
6 applications. For food safety issues, include recommendations for  
7 consulting with food processing authorities, food scientists, academia,  
8 professional organizations, other government agencies including the FDA  
9 Regional Food Specialist, or other experts external to the agency.  
10 3) Set reasonable timelines for decision making. Determine if the variance  
11 application addresses an intrastate or interstate issue.  
12 a) For variances that have interstate or national implications, especially  
13 those that address food safety, regulators are urged to contact and work  
14 closely with their FDA Regional Food Specialist to determine if a  
15 national policy related to the issue exists. Regulators are encouraged to  
16 be consistent with national policies, guidelines, or opinions.  
17 b) For variances that address intrastate issues, regulators are also  
18 encouraged to determine if other State or national guidance exists,  
19 and to stay consistent with it.  
20 4) Make the agency's decision. Inform the applicant.  
21 a) If the variance request is approved, determine the starting date and  
22 document all special provisions with which the applicant must comply.  
23 b) If the variance request is denied, inform the applicant as to the reasons  
24 for the denial, the applicant's right to appeal, and the appeal process.  
25 5) Inform other interested parties, including the FDA Regional Food Specialist.  
26 a) For variances having interstate or national implications, especially those  
27 that address food safety, regulators are urged to inform their FDA  
28 Regional Food Specialist so that FDA is aware of, and can  
29 appropriately disseminate the information regarding food safety variances  
30 that may affect food establishments in other jurisdictions, such as

1 national chains.

2 b) For variances that address intrastate issues, regulators are encouraged  
3 to share the information as if it were an interstate issue.

4 6) Document all agency actions and decisions in the facility's file. Consider  
5 including documentation of special variance provisions on the establishment's  
6 permit to operate.

7 7) If the variance is approved, inform the inspector assigned to that facility  
8 and train the inspector on the variance provisions, including the  
9 implementation of the industry's HACCP plan, if required.

10 8) Establish procedures to periodically review the status of the variance,  
11 determine if it successfully accomplishes its public health objective, and ensure  
12 that a health hazard or nuisance does not result from its implementation.

13 9) Establish written procedures for withdrawing approval of the variance if it  
14 is not successful.

15 **3-502.12 Reduced Oxygen Packaging, Criteria.\***

16 Reduced oxygen packaging (ROP) encompasses a large variety of packaging  
17 methods where the internal environment of the package contains less than the  
18 normal ambient oxygen level (typically 21% at sea level), including vacuum  
19 packaging (VP), modified atmosphere packaging (MAP), controlled atmosphere  
20 packaging (CAP), cook chill processing (CC), and sous vide (SV). Using ROP  
21 methods in food establishments has the advantage of providing extended  
22 shelf life to many foods because it inhibits spoilage organisms that are  
23 typically aerobic.

24 This state of reduced oxygen is achieved in different ways. Oxygen can be  
25 withdrawn from the package (VP) with or without having another gas such as  
26 nitrogen or carbon dioxide replacing it (MAP). Fresh produce and raw meat or  
27 poultry continue to respire and use oxygen after they are packaged. Bacterial  
28 activity also plays a role here. Packaging material that readily allow the  
29 transmission of oxygen is usually designated by an Oxygen Transfer Rate of  
30 10,000 cm<sup>2</sup>/m<sup>3</sup>/24 hours or greater. A reduced oxygen atmosphere will result with

1 an Oxygen Transmission rate of 10-100. The process of cooking drives off  
2 oxygen (the bubbling is oxygen gas coming off) and leaves a reduced oxygen  
3 level in the food, thus, microenvironments of reduced oxygen are possible  
4 even without packaging that has a barrier to oxygen transmission.

5 Most foodborne pathogens are anaerobes or facultative anaerobes able to  
6 multiply under either aerobic or anaerobic conditions, therefore special  
7 controls are necessary to control their growth. Refrigerated storage  
8 temperatures of 5°C (41°F) may be adequate to prevent growth and/or toxin  
9 production of some pathogenic microorganisms but non-proteolytic ***C. botulinum***  
10 and ***L. monocytogenes*** are able to multiply well below 5°C (41°F). For this  
11 reason, ***C. botulinum*** and ***L. monocytogenes*** become the pathogens of  
12 concern for ROP. Controlling their growth will control the growth of other  
13 foodborne pathogens as well.

14 The control of ***C. botulinum*** or ***L. monocytogenes*** when using ROP is  
15 usually accomplished using multiple hurdles or barriers to growth. Subparagraph  
16 3-502.12(B)(2) identifies secondary barriers that will control the growth of ***C.***  
17 ***botulinum*** and ***L. monocytogenes*** when used in conjunction with a food  
18 storage temperature of 5°C (41°F) or less. They include  $a_w$  of 0.91 or less; pH  
19 of 4.6 or less; cured, USDA inspected meat or poultry products using  
20 substances specified in 9 CFR 424.21; or high levels of competing  
21 microorganisms. ***C. botulinum*** will not produce toxin below an  $a_w$  of 0.91.  
22 Nitrite, used in meat and poultry curing, inhibits the outgrowth of ***C. botulinum***  
23 spores. Most foodborne pathogens do not compete well with other  
24 microorganisms, therefore foods that have a high level of spoilage organisms  
25 or lactic acid bacteria can safely be packaged using ROP.

26 Naturally fermented cheeses, as identified in ¶ 3-502.12(E), that meet the  
27 Standards of Identity for hard, pasteurized process, and semisoft cheeses in 21  
28 CFR 133.150, 21 CFR 133.169, or 21 CFR 133.187, respectively, contain  
29 various intrinsic factors, often acting synergistically, that together act as a  
30 secondary barrier to pathogen growth along with refrigerated storage at 5°C

1 (41°F) or less. This combination of factors could include some or all of the  
2 following: a lower pH, production of organic acids, and natural antibiotics or  
3 bacteriocins such as nisin by lactic acid bacteria, salt (NaCl) added during  
4 processing, low moisture content, added preservatives, and live competing  
5 cultures. Very few outbreaks have occurred that were associated with cheese.  
6 The few outbreaks of foodborne illness associated with cheeses or cheese  
7 products could be traced in large part to temperature abuse with storage at  
8 uncontrolled ambient air temperatures. Examples of cheeses that may be  
9 packaged under ROP include Asiago medium, Asiago old, Cheddar, Colby,  
10 Emmentaler, Gruyere, Parmesan, Reggiano, Romano, Sapsago, Swiss, pasteurized  
11 process cheese, Asiago fresh and soft, Blue, Brick, Edam, Gorgonzola, Gouda,  
12 Limburger, Monterey, Monterey Jack, Muenster, Provolone, and Roquefort. Soft  
13 cheeses such as Brie, Camembert, Cottage, and Ricotta may not be packaged  
14 under reduced oxygen because of their ability to support the growth of *L.*  
15 *monocytogenes* under modified atmosphere conditions.

16 When the food to be packaged under reduced oxygen conditions cannot  
17 reliably depend on secondary barriers such as  $a_w$ , pH, nitrite in cured meat  
18 products, high levels of competing microorganisms or intrinsic factors in certain  
19 cheeses, time/temperature becomes the critical controlling factor for growth of  
20 *C. botulinum* and *L. monocytogenes*. In ¶ 3-502.12(D), cook-chill processing  
21 where food is cooked then sealed in a barrier bag while still hot and sous vide  
22 processing where food is sealed in a barrier bag and then cooked, both  
23 depend on time/temperature alone as the only barrier to pathogenic growth.  
24 Therefore, monitoring critical limits including those established for cooking to  
25 destroy vegetative cells, cooling to prevent outgrowth of spores/toxin  
26 production, and maintaining cold storage temperatures of 1°C (34°F) or less to  
27 inhibit growth and/or toxin production of any surviving pathogens is essential.  
28 Since there are no other controlling factors for *C. botulinum* and *L.*  
29 *monocytogenes* in a cook-chill or sous vide packaging system, temperature  
30 control must be continuously monitored electronically and visually examined

1 twice daily to verify that refrigeration temperatures are adequate.

2 New technology makes it relatively easy to continuously and electronically  
3 monitor temperatures of refrigeration equipment used to hold cook chill and  
4 sous vide products at 1°C (34°F) or less. Thermocouple data loggers can  
5 connect directly with commonly available thermocouple probes. Recording  
6 charts are also commonly used. Temperature monitors and alarm systems will  
7 activate an alarm or dialer if temperatures rise above preset limits. Nickel-  
8 sized data loggers are available to record temperatures which can be displayed  
9 using computer software. Since surveys have shown that temperature control  
10 in home kitchens is not always adequate, food packaged using cook chill or  
11 sous vide processing methods cannot be distributed outside the control of the  
12 food establishment doing the packaging.

13 Time is also a factor that must be considered in ROP. The 14 day “use by”  
14 date is required label information for VP, MAP, and CAP products and cannot  
15 exceed the manufacturer’s “sell by” or “use by” date. This is considered a  
16 safe time period because two barriers to growth are required to be present.  
17 When these ROP products are frozen, there is no longer a restricted 14 day  
18 shelf life. The 30 day shelf life for cook chill and sous vide is based on killing  
19 all vegetative cells in the cooking process, preventing recontamination, and  
20 then refrigerating at 34°F or less with stringent temperature monitoring and  
21 recording requirements. These criteria allow both institutional-sized cook chill  
22 operations that may feed thousands daily, often including transportation to  
23 their satellite locations, and individual restaurants without ice banks and  
24 tumble or blast chillers to safely use cook chill processes.

25 The extended shelf life for vacuum packaged hard and semisoft cheeses is  
26 based on many intrinsic factors in these cheeses plus the normal refrigeration  
27 temperature of 41°F or less to maintain safety.

28 A Hazard Analysis Critical Control Point (HACCP) plan is essential when using  
29 ROP processing procedures. ***C. botulinum*** and ***L. monocytogenes*** are  
30 potential hazards which must be controlled in most foods unless the food is a low

1 acid canned food produced under 21 CFR Part 108 or 113 or an acidified food  
2 produced under 21 CFR 114. Critical control points, critical limits, monitoring,  
3 record keeping, corrective actions, and verification procedures will vary based  
4 on the type of food and type of ROP technology used.

5 When a food establishment intends to use ROP technology but does not  
6 use one of the secondary barriers defined in section 3-502.12 (a single barrier  
7 of 34°F combined with the criteria specified in paragraph 3-502.12(D), or  
8 hard or semisoft cheeses manufactured using Standards of Identity for those  
9 cheeses), the operator must submit an application for a variance under 3-  
10 502.11 providing evidence that the ROP methodology intended for use is  
11 safe.

12 Unfrozen raw fish and other seafood are specifically excluded from ROP  
13 because of these products' natural association with *C. botulinum* type E which  
14 grows at or above 3°C (37-38°F). Fish and seafood that are frozen before,  
15 during and after the ROP packaging process are allowed.

16	<b>Accurate</b>	<b>3-601.11</b>	<b>Standards of Identity.</b>
17	<b>Representation</b>	<b>3-601.12</b>	<b>Honestly Presented.</b>
18	<b>Labeling</b>	<b>3-602.11</b>	<b>Food Labels.</b>
19		<b>3-602.12</b>	<b>Other Forms of Information.</b>

20 The identity of a food in terms of origin and composition is important for  
21 instances when a food may be implicated in a foodborne illness and for  
22 nutritional information requirements. Ingredient information is needed by  
23 consumers who have allergies to certain food or ingredients. The appearance  
24 of a food should not be altered or disguised because it is a cue to the  
25 consumer of the food's identity and condition.

26 Recent illnesses and deaths from Shiga toxin-producing *Escherichia coli* have  
27 occurred across the United States as a result of people eating hamburgers  
28 that were contaminated and then undercooked. USDA issued final rules on  
29 August 8, 1994 requiring all raw meat or poultry products have a safe-

1 handling label or sticker or be accompanied by a leaflet that contains  
2 information on proper handling and cooking procedures.

3 Certain requirements in the CFR relating to aspects of nutrition labeling  
4 became effective in May, 1997. The following attempts to provide guidance  
5 regarding those requirements and exemptions as they relate to the retail  
6 environment and to alert regulators to authority that has been given to them  
7 by the Nutrition Labeling and Education Act (NLEA) of 1990. The statute  
8 and the CFR should be reviewed to ensure a comprehensive understanding of  
9 the labeling requirements.

10 I. The following foods need not comply with nutrition labeling in the  
11 CFR referenced in subparagraph 3-602.11(B)(5) if they do not bear  
12 a nutrient claim, health claim, or other nutrition information:

13 (A) Foods packaged in a food establishment if:

14 (1) The food establishment has total annual sales to consumers  
15 of no more than \$500,000 (or no more than \$50,000 in  
16 food sales alone), and

17 (2) The label of the food does not bear a reference to the  
18 manufacturer or processor other than the food  
19 establishment;

20 (B) Low-volume food products if:

21 (1) The annual sales are less than 100,000 units for which a  
22 notification claiming exemption has been filed with FDA's  
23 Office of Nutritional Products Labeling and Dietary  
24 Supplements Food Labeling by a small business with less  
25 than 100 full-time equivalent employees, or

26 (2) The annual sales are less than 10,000 units by a small  
27 business with less than 10 full-time equivalent employees;

28 (C) Foods served in food establishments with facilities for immediate  
29 consumption such as restaurants, cafeterias, and mobile food  
30 establishments, and foods sold only in those establishments;

- 1 (D) Foods similar to those specified in the preceding bullet but that  
2 are sold by food establishments without facilities for immediate  
3 consumption such as bakeries and grocery stores if the food is:  
4 (1) Ready-to-eat but not necessarily for immediate  
5 consumption,  
6 (2) Prepared primarily in the food establishment from which it  
7 is sold, and  
8 (3) Not offered for sale outside the food establishment;  
9 (E) Foods of no nutritional significance such as coffee;  
10 (F) Bulk food for further manufacturing or repacking; and  
11 (G) Raw fruits, vegetables, and fish.
- 12 II. Game animal meats shall provide nutrition information which  
13 may be provided by labeling displayed at the point of purchase  
14 such as on a counter card, sign, tag affixed to the food, or some  
15 other appropriate device.
- 16 III. Food packaged in a food processing plant or another food  
17 establishment, shall meet the requirements specified in § 3-602.11  
18 and enforcement by the regulatory authority is authorized in the  
19 NLEA, Section 4. State Enforcement.

20 In 1998, 21 CFR Part 73, Section 73.75 was amended to address  
21 canthaxanthin as a color additive for salmonid fish. According to the FDA  
22 Regulatory Fish Encyclopedia, the family Salmonidae includes pink salmon,  
23 coho salmon, sockeye salmon, chinook salmon, Atlantic salmon, chum  
24 salmon, rainbow trout, cutthroat trout, and brown trout. This color additive  
25 may be in the feed that is fed to aquacultured fish, and when those fish are  
26 placed into a bulk container for shipment, the bulk container must bear a label  
27 declaring the presence of canthaxanthin. That same label information must be  
28 displayed at retail when those fish are offered for sale.

29 The 21 CFR Section 73.75(d)(4) requires that the presence of the color  
30 additive in salmonid fish that have been fed feeds containing canthaxanthin be

1 declared in accordance with 21 CFR 101.22(b), (c), and (k)(2) and  
2 101.100(a)(2). For additional information, see the Federal Register  
3 announcement 63 FR 14814, March 27, 1998, Listing of Color Additives  
4 Exempt from Certification; Canthaxanthin.

5 On August 2, 2004, President Bush signed into law the Food Allergen Labeling  
6 and Consumer Protection Act of 2004 (Public Law 108-282). This new law  
7 amended Sections 201 and 403 of the Federal Food, Drug, and Cosmetic Act  
8 to establish food allergen labeling requirements for all packaged foods  
9 regulated by FDA. The new provisions require that all affected packages of  
10 food labeled on or after January 1, 2006 must identify on the label the  
11 names of the food sources of any major food allergens (i.e., the following eight  
12 foods and any protein derived from them: milk, egg, fish, crustacean shellfish,  
13 tree nuts, wheat, peanuts, and soybeans) used as ingredients in the food.  
14 The names of the food sources are the same as the names of the eight  
15 foods that are major food allergens, with the exception that for fish,  
16 crustacean shellfish, and tree nuts, their respective food source names are  
17 the specific species of fish (e.g., bass, flounder, or cod), the specific species  
18 of crustacean shellfish (e.g., crab, lobster, or shrimp), and the specific types of  
19 tree nuts (e.g., almonds, pecans, or walnuts).

20 **Consumer 3-603.11 Consumption of Raw or Undercooked Animal**  
21 **Advisory Foods.\***

22 Refer to the public health reason for § 3-401.11.

23 **Purpose:**

24 At issue is the role of government agencies, the regulated industry, and others  
25 in providing notice to consumers that animal-derived foods that are not  
26 subjected to adequate heat treatment pose a risk because they may contain  
27 biological agents that cause foodborne disease. The deliverance of a  
28 balanced message that communicates fairly to all consumers and, where  
29 epidemiologically supported, attempts to place risk in perspective based on  
30 the consumer's health status and the food being consumed is part of the

1 challenge. Notification of risk must be achieved via a meaningful message  
2 and in a manner that is likely to affect behavior. The following information is to  
3 alert the reader to the options available to food establishments in advising  
4 consumers of the increased possibility of foodborne illness when animal-  
5 derived foods are eaten raw or undercooked.

6 **Background:**

7 Although no specific advisory language was recommended, beginning with the  
8 1993 Food Code, FDA included a codified provision for a point-of-purchase  
9 consumer advisory and stated in Annex 3:

10 “FDA has requested comments and will consider the responses as well  
11 as other information that is available related to the risks involved and  
12 methods of risk communication to determine what action may be necessary by  
13 FDA to effectively inform consumers.”

14 **Consumer Focus Groups:**

15 During 1996 - 1998, FDA conducted two different consumer focus group  
16 studies. Because the first set of focus groups (conducted before the 1997  
17 Code) were not receptive to the language recommended at the 1996  
18 Conference for Food Protection (CFP) meeting, that language was not  
19 included in the 1997 Code. Before the 1998 CFP meeting, the Agency  
20 convened a second set of focus groups with a modified approach. The latter  
21 set expressed similar thoughts as those in the earlier set and a pattern for  
22 consumer acceptance and receptiveness to menu-based advisories emerged.  
23 It became apparent that there is a general appreciation for “**disclosure**” of what  
24 consumers view as “hidden ingredients,” for example, whether a particular  
25 menu item contains raw egg. In addition to disclosure being viewed as helpful,  
26 consumers are accepting, if not appreciative, of a “**reminder**” that  
27 consuming raw or undercooked animal-derived foods carries an increased risk  
28 of foodborne illness. In the food establishment venue, consumers are less  
29 willing to accept a message that extends beyond a reminder and becomes a  
30 lesson or an educational message.

1           **Satisfactory Compliance:**

2           FDA submitted to the 1998 CFP meeting an Issue that asked the  
3           Conference to discuss an approach that incorporated the knowledge obtained  
4           from the consumer testing. It was the consensus of the CFP that  
5           **satisfactory compliance with the Code’s consumer advisory provision is**  
6           **fulfilled when both a disclosure and reminder are provided**, as described in §  
7           3-603.11 of the Code. **Disclosure is** achieved when there is clear  
8           identification of animal-derived foods that are sold or served raw or  
9           undercooked, and of items that either contain or may contain (to allow for  
10          ingredient substitution) such raw or undercooked ingredients. A third option  
11          for the consumer “reminder” was added later. The **reminder is** a notice  
12          about the relationship between thorough cooking and food safety.

13          Two options were endorsed for disclosure and two for the reminder. One of  
14          the reminder options is a menu statement that advises consumers that food  
15          safety information about the disclosed items is available upon request.  
16          Essential criteria for such written information are available, with a  
17          downloadable model brochure, on the CFSAN website at  
18          <http://www.cfsan.fda.gov/~fc99guid.html>. All brochures must meet these  
19          essential criteria. The other option is a short notice alerting consumers to the  
20          increased risk of consuming the disclosed menu items.

21          In response to concerns raised by the Interstate Shellfish Sanitation  
22          Conference (ISSC) in an October 8, 1998 letter to FDA, a third option has  
23          been added to allow for a statement that links an increased risk of illness to  
24          consumption of raw or undercooked animal foods by persons with certain  
25          medical conditions.

26          The information contained in both the disclosure and reminder should be  
27          publicly available and readable so that consumers have benefit of the total  
28          message (disclosure and reminder) before making their order selections.

29          It is not possible to anticipate all conceivable situations. Therefore, there will  
30          always be need for discussion between the food establishment and the

1 Regulatory Authority as to the most effective way to meet the objectives of  
2 satisfactory compliance.

3 The *Implementation Guidance for the Consumer Advisory Provision of the FDA*  
4 *Food Code* (section 3-603.11 in the FDA Model Food Code), is a resource  
5 intended to assist regulators and industry in the implementation of the  
6 Consumer Advisory provision. It is recommended that it be used in  
7 conjunction with the FDA Food Code. It is available on the FDA/CFSSAN  
8 website at <http://www.cfsan.fda.gov/~dms/fc99guid.html>.

### 9 **Locating the Advisory:**

10 Disclosure of raw or undercooked animal-derived foods or ingredients and  
11 reminders about the risk of consuming such foods belong at the point where  
12 the food is selected by the consumer. Both the disclosure and the reminder  
13 need to accompany the information from which the consumer makes a selection.

14 That information could appear in many forms such as a menu, a placarded listing  
15 of available choices, or a table tent.

### 16 **Educational Messages:**

17 Educational messages are usually longer, more didactic in nature, and  
18 targeted to consumers who have been alerted to the food safety concern and  
19 take the initiative to obtain more detailed information. It is expected that, in  
20 most cases, educational messages that are provided pursuant to § 3-603.11  
21 (i.e., in situations where the option for referring the consumer to additional  
22 information is chosen), will be embodied in brochures that will not be read at  
23 the site where the immediate food choice is being made. Nonetheless, such  
24 messages are viewed as an important facet of arming consumers with the  
25 information needed to make informed decisions and, because the information is  
26 being requested by the consumer, it would be expected to play a role in  
27 subsequent choices.

### 28 **Applicability:**

29 *Food Establishments:*

1 The consumer advisory is intended to apply to all food establishments where  
2 raw or undercooked animal foods or ingredients are sold or served for human  
3 consumption in a raw or undercooked form. This includes all types of food  
4 establishments whenever there is a reasonable likelihood that the food will be  
5 consumed without subsequent, thorough cooking - such as restaurants, raw  
6 bars, quick-service operations, carry-outs, and sites where groceries are  
7 obtained that have operations such as delicatessens or seafood departments.

8 *“...Otherwise Processed to Eliminate Pathogens...”*:

9 This phrase is included in § 3-603.11 to encompass new technologies and  
10 pathogen control/reduction regimens as they are developed and validated as  
11 fulfilling a specific performance standard for pathogens of concern.  
12 Pasteurization of milk is an example of a long-standing validated process. For  
13 purposes of the Food Code, the level of pathogen reduction that is required  
14 before a raw or undercooked animal food is allowed to be offered without a  
15 consumer advisory must be equivalent to the levels provided by § 3-401.11 for  
16 the type of food being prepared.

17 The absorbed dose levels of radiation approved by FDA on December 3,  
18 1997 for red meat are insufficient to reduce the level of most vegetative  
19 pathogens to a point that is equivalent to the reductions achieved in ¶¶ 3-  
20 401.11(A) and (B). Irradiated poultry provides a 3D kill which does not  
21 provide the level of protection of the 7D kill that results from the cooking  
22 regimen in the Food Code. Therefore, irradiated meat and poultry are not  
23 allowed to be offered in a ready-to-eat form without a consumer advisory. It is  
24 intended that future Food Code revisions will address time/temperature  
25 requirements that take into consideration the pathogen reduction that occurs  
26 with irradiated foods.

27 *Recognition of Other Processes:*

28 Animal-derived foods may undergo validated processes that target a specific  
29 pathogen. In such instances, along with the required consumer advisory may  
30 appear additional language that accurately describes the process and what it

1 achieves. For example, a technology for reducing *Vibrio vulnificus* in oysters  
2 to nondetectable levels has been validated. FDA concurs that shellfish  
3 subjected to that process can be labeled with a truthful claim that  
4 appropriately describes the product. That is, a statement could be made  
5 such as, “pasteurized to reduce *Vibrio vulnificus*” or “temperature treated to  
6 reduce *Vibrio vulnificus*.” Such a claim must be in accordance with labeling  
7 laws and regulations, accurate, and not misleading. The claim would not,  
8 however, negate the need for a consumer advisory because the treatment  
9 only reduces the level of one pathogenic organism.

10 *Product-specific Advisories:*

11 Consumer advisories may be tailored to be product-specific if a food  
12 establishment either has a limited menu or offers only certain animal-derived  
13 foods in a raw or undercooked ready-to-eat form. For example, a raw bar  
14 serving molluscan shellfish on the half shell, but no other raw or undercooked  
15 animal food, could elect to confine its consumer advisory to shellfish. The raw  
16 bar could also choose reminder, option #3, which would highlight the  
17 increased risk incurred when persons with certain medical conditions ingest  
18 shellfish that has not been adequately heat treated.

19 *Terminology:*

20 It should be noted that the actual on-site (e.g., on-the-menu) advisory  
21 language differs from the language in the codified provision, § 3-603.11. In the  
22 insert page for § 3-603.11, the **Reminder** options 2 and 3 use terms for  
23 foods that are less specific than the terms used in the actual code section.  
24 That is, the words “meat” rather than “beef, lamb, and pork” and “seafood”  
25 rather than “fish” are used. Categorical terms like “meat” are simpler and  
26 may be more likely used in conversation, making them suitable for purposes  
27 of a menu notice.

1 *Milk:*

2 In addition, “milk” is not mentioned in the actual on-site advisory language.  
3 The sale or transportation of final packaged form of unpasteurized milk into  
4 interstate commerce is specifically prohibited by 21 CFR 1240.61. Also the  
5 consumption of raw milk is not recommended by FDA (this statement is in  
6 the form of an official FDA position statement found at  
7 <http://www.cfsan.fda.gov/~ear/mi-03-4.html>). Nonetheless, approximately 27 states  
8 allow unpasteurized milk in intrastate commerce which usually involves direct  
9 dairy farm-to-consumer procurement.

10 In the event that a food establishment governed by § 3-603.11 of this Code  
11 operates in conjunction with a dairy farm in a State that allows the in-State sale  
12 or service of unpasteurized milk, or in the case where a State allows  
13 unpasteurized milk to be marketed via retail-level food establishments,  
14 consumers need to be advised of the risk associated with drinking  
15 unpasteurized milk. In these situations, the actual advisory language needs to  
16 be amended to include milk (refer to Consumer Advisory Reminder, paragraph  
17 3-603.11(C), options 2 or 3).

18 *Molluscan Shellstock:*

19 In addition to areas of retail food stores such as delis in supermarkets, the  
20 consumer advisory is to be provided when a seafood department or seafood  
21 market offers raw molluscan shellstock for sale or service. There is a risk of  
22 death from **Vibrio** infections from consuming raw molluscan shellstock for  
23 persons who have certain medical conditions.

24 **Disposition 3-701.11 Discarding or Reconditioning Unsafe,**  
25 **Adulterated, or Contaminated Food.\***

26 Pathogens may be transmitted from person to person through contaminated  
27 food. The potential spread of illness is limited when food is discarded if it  
28 may have been contaminated by employees who are infected, or are  
29 suspected of being infected, or by any person who otherwise contaminates it.

1 susceptible populations may also wish to use fruit and vegetables that are  
2 produced as commercially sterile products (canned fruit or vegetables) as a  
3 means of enhancing food safety.

4 Salmonella often survives traditional preparation techniques. It survives in a  
5 lightly cooked omelet, French toast, stuffed pasta, and meringue pies. In 1986  
6 there was a large multistate outbreak of **Salmonella Enteritidis** traced to  
7 stuffed pasta made with raw eggs and labeled “fully cooked.” Eggs remain a  
8 major source of these infections, causing large outbreaks when they are  
9 combined and undercooked as was the case in the 1986 outbreak linked to  
10 stuffed pasta. Therefore, special added precautions need to be in place with  
11 those most susceptible to foodborne illness.

12 Operators of food establishments serving highly susceptible populations may  
13 wish to discuss buyer specifications with their suppliers. Such specifications  
14 could stipulate eggs that are produced only by flocks managed under a  
15 **Salmonella Enteritidis** control program that is recognized by a regulatory  
16 agency that has animal health jurisdiction. Such programs are designed to  
17 reduce the presence of **Salmonella Enteritidis** in raw shell eggs. In any  
18 case, the food establishment operator must use adequate time and temperature  
19 controls within the establishment to minimize the risk of a foodborne illness  
20 outbreak relating to **Salmonella Enteritidis**.

21 Since 1995, raw seed sprouts have emerged as a recognized source of  
22 foodborne illness in the United States. The FDA and CDC have issued health  
23 advisories that persons who are at a greater risk for foodborne disease should  
24 avoid eating raw alfalfa sprouts until such time as intervention methods are in  
25 place to improve the safety of these products. Further information is available  
26 at the FDA website, <http://www.fda.gov>, by entering “sprouts” in the search  
27 window.

28 Although the Code’s allowance for the Regulatory Authority to grant a variance  
29 (refer to §§ 8-103.10 - .12, 8-201.14, and 8-304.11) is applicable to all Code  
30 provisions, variance requests related to the preparation of food for highly

1 susceptible populations must be considered with particular caution and  
2 scrutiny. With all variances, the hazard(s) must be clearly identified and  
3 controlled by a HACCP plan that is instituted in conjunction with a standard  
4 operating plan that implements good retail practices. Variances that will impact  
5 a highly susceptible population must be considered in light of the fact that  
6 such a population is at a significantly higher risk of contracting foodborne  
7 illnesses and suffering serious consequences including death from those  
8 illnesses, than is the general population.

9 Subparagraph 3-801.11(F)(3) requires a HACCP plan for the use of raw shell  
10 eggs when eggs are combined in food establishments serving highly  
11 susceptible populations. A variance is not required since the HACCP plan  
12 criteria are specific, prescriptive, and conservative and require a cooking  
13 temperature and time to ensure destruction of **Salmonella Enteritidis**.

#### 14 **3-801.11(G) and (H) Re-service of food**

15 The Food Code addresses two issues concerning persons in isolation:

16 1. Contamination from an isolated patient to others outside.

17 The re-service of any food including unopened, original, intact packages in  
18 sound condition, of non-potentially hazardous food (temperature controlled for  
19 safety) from a person in isolation or quarantine for use by anyone else (other  
20 patients, clients, or consumers) is not permitted. The “isolation or quarantine”  
21 terminology in the Code text refers to a patient-care setting that isolates the  
22 patient, thereby preventing spread of key pathogens to other patients and  
23 healthcare workers. Once food packages come to a contact isolation room, they  
24 stay there until the patient uses or discards them. If packages of food are  
25 still in the room when the patient is discharged or moved from isolation,  
26 they must be discarded.

27 2. Contamination from the outside into a room with a patient in a “protective  
28 environment” isolation setting which protects the patient from contacting  
29 pathogens from other patients, healthcare workers, or other persons.

30 Packages of food from any patients, clients or other consumers should not be

1 re-served to persons in protective environment isolation. Precautions similar to  
2 the isolation setting apply to this setting, i.e., once an unopened, original,  
3 intact package of condiment is delivered to this patient, the package stays there  
4 until used or discarded. New (not re-served) packages of food should be  
5 delivered to this patient each time.

6 To summarize the key difference between the two scenarios:

- 7 • Food packages served to patients in contact isolation may not be  
8 re-served to other patients because of the potential for disease  
9 transmission to other patients.
- 10 • Patients in protective environments should not be re-served with  
11 food packages from other patients because of the potential for  
12 disease transmission to the protective environment patient.

#### 13 **Chapter 4 Equipment, Utensils, and Linens**

##### 14 ***Multiuse* 4-101.11 Characteristics.\***

15 Multiuse equipment is subject to deterioration because of its nature, i.e.,  
16 intended use over an extended period of time. Certain materials allow  
17 harmful chemicals to be transferred to the food being prepared which could  
18 lead to foodborne illness. In addition, some materials can affect the taste of the  
19 food being prepared. Surfaces that are unable to be routinely cleaned and  
20 sanitized because of the materials used could harbor foodborne pathogens.  
21 Deterioration of the surfaces of equipment such as pitting may inhibit  
22 adequate cleaning of the surfaces of equipment, so that food prepared on or in  
23 the equipment becomes contaminated.

24 Inability to effectively wash, rinse and sanitize the surfaces of food  
25 equipment may lead to the buildup of pathogenic organisms transmissible  
26 through food. Studies regarding the rigor required to remove biofilms from  
27 smooth surfaces highlight the need for materials of optimal quality in multiuse  
28 equipment.

##### 29 **4-101.12 Cast Iron, Use Limitation.**

30 Equipment and utensils constructed of cast iron meet the requirement of

1 durability as intended in section 4-101.11. However, the surface  
2 characteristics of cast iron tend to be somewhat porous which renders the material  
3 difficult to clean. On the other hand, when cast iron use is limited to cooking  
4 surfaces the residues in the porous surface are not of significant concern as  
5 heat destroys potential pathogens that may be present.

#### 6 **4-101.13 Lead, Use Limitation.**

7 Historically, lead has been used in the formulation or decoration of these  
8 types of utensils. Specifically, lead-based paints that were used to decorate  
9 the utensils such as color glazes have caused high concentrations of lead to  
10 leach into the food they contain.

11 Lead poisoning continues to be an important public health concern due to the  
12 seriousness of associated medical problems. Lead poisoning is particularly  
13 harmful to the young and has caused learning disabilities and medical  
14 problems among individuals who have consumed high levels. The allowable  
15 levels of lead are specific to the type of utensil, based on the average contact  
16 time and properties of the foods routinely stored in each item listed.

17 FDA has established maximum levels (see FDA Compliance Policy Guide  
18 Section 545.450 Pottery (Ceramics); Imported and Domestic – Lead  
19 Contamination (CPG 7117.07) for leachable lead in ceramicware, and pieces that  
20 exceed these levels are subject to recall or other agency enforcement action.

21 The levels are based on how frequently a piece of ceramicware is used, the  
22 type and temperature of the food it holds, and how long the food stays in  
23 contact with the piece. For example, cups, mugs, and pitchers have the most  
24 stringent action level, 0.5 parts per million, because they can be expected to  
25 hold food longer, allowing more time for lead to leach. Also, a pitcher may be  
26 used to hold fruit juice. And a coffee mug is generally used every day to  
27 hold a hot acidic beverage, often several times a day.

28 The FDA allows use of lead glazes because they're the most durable, but  
29 regulates them tightly to ensure their safety. Commercial manufacturers employ  
30 extremely strict and effective manufacturing controls that keep the lead from

1 leaching during use. Small potters often can't control the firing of lead glazes  
2 as well so their ceramics are more likely to leach illegal lead levels, although  
3 many do use lead-free glazes.

4 In 21 CFR 109.16, FDA requires high-lead-leaching decorative ceramicware  
5 to be permanently labeled that it's not for food use and may poison food.  
6 Such items bought outside the United States may not be so labeled,  
7 potentially posing serious risk if used for food.

8 Pewter refers to a number of silver-gray alloys of tin containing various  
9 amounts of antimony, copper, and lead. The same concerns about the  
10 leaching of heavy metals and lead that apply to brass, galvanized metals,  
11 copper, cast iron, ceramics, and crystal also apply to pewter. As previously  
12 stated, the storage of acidic moist foods in pewter containers could result in  
13 food poisoning (heavy metal poisoning).

14 Solder is a material that is used to join metallic parts and is applied in the  
15 melted state to solid metals. Solder may be composed of tin and lead alloys.

#### 16 **4-101.14 Copper, Use Limitation.\***

17 High concentrations of copper are poisonous and have caused foodborne  
18 illness. When copper and copper alloy surfaces contact acidic foods, copper may  
19 be leached into the food. Carbon dioxide may be released into a water supply  
20 because of an ineffective or nonexistent backflow prevention device between a  
21 carbonator and copper plumbing components. The acid that results from  
22 mixing water and carbon dioxide leaches copper from the plumbing  
23 components and the leachate is then transferred to beverages, causing copper  
24 poisoning. Backflow prevention devices constructed of copper and copper  
25 alloys can cause, and have resulted in, the leaching of both copper and lead into  
26 carbonated beverages.

27 Brass is an alloy of copper and zinc and contains lead which is used to  
28 combine the two elements. Historically, brass has been used for items such  
29 as pumps, pipe fitting, and goblets. All 3 constituents are subject to leaching

1 when they contact acidic foods, and food poisoning has resulted from such  
2 contact.

3 The steps in beer brewing include malting, mashing, fermentation, separation of  
4 the alcoholic beverage from the mash, and rectification. During mashing, it is  
5 essential to lower the pH from its normal 5.8 in order to optimize enzymatic  
6 activity. The pH is commonly lowered to 5.1-5.2, but may be adjusted to as low  
7 as 3.2. The soluble extract of the mash (wort) is boiled with hops for 1 to 22  
8 hours or more. After boiling, the wort is cooled, inoculated with brewers yeast,  
9 and fermented. The use of copper equipment during the prefermentation and  
10 fermentation steps typically result in some leaching of copper.

11 Because copper is an essential nutrient for yeast growth, low levels of copper  
12 are metabolized by the yeast during fermentation. However, studies have shown  
13 that copper levels above 0.2 mg/L are toxic or lethal to the yeast. In addition,  
14 copper levels as low as 3.5 mg/L have been reported to cause symptoms of  
15 copper poisoning in humans. Therefore, the levels of copper necessary for  
16 successful beer fermentation (i.e., below 0.2 mg/L) do not reach a level that  
17 would be toxic to humans.

18 Today, domestic beer brewers typically endeavor to use only stainless steel or  
19 stainless steel-lined copper equipment (piping, fermenters, filters, holding tanks,  
20 bottling machines, keys, etc.) in contact with beer following the hot brewing steps  
21 in the beer making process. Some also use pitch-coated oak vats or glass-lined  
22 steel vats following the hot brewing steps. Where copper equipment is not used  
23 in beer brewing, it is common practice to add copper (along with zinc) to provide  
24 the nutrients essential to the yeast for successful fermentation.

25 **4-101.15 Galvanized Metal, Use Limitation.\***

26 Galvanized means iron or steel coated with zinc, a heavy metal that may be  
27 leached from galvanized containers into foods that are high in water content.  
28 The risk of leaching increases with increased acidity of foods contacting the  
29 galvanized container.

30 **4-101.16 Sponges, Use Limitation.**

1 Sponges are difficult, if not impossible, to clean once they have been in contact  
2 with food particles and contaminants that are found in the environment. Because of  
3 their construction, sponges provide harborage for any number and variety of  
4 microbiological organisms, many of which may be pathogenic. Therefore,  
5 sponges are to be used only where they will not contaminate cleaned and  
6 sanitized or in-use, food-contact surfaces such as for cleaning equipment and  
7 utensils before rinsing and sanitizing.

8 **4-101.17 Wood, Use Limitation.**

9 The limited acceptance of the use of wood as a food-contact surface is  
10 determined by the nature of the food and the type of wood used. Moist foods  
11 may cause the wood surface to deteriorate and the surface may become difficult  
12 to clean. In addition, wood that is treated with preservatives may result in illness  
13 due to the migration of the preservative chemicals to the food; therefore, only  
14 specific preservatives are allowed.

15 **4-101.18 Nonstick Coatings, Use Limitation.**

16 Perfluorocarbon resin is a tough, nonporous and stable plastic material that  
17 gives cookware and bakeware a surface to which foods will not stick and that  
18 cleans easily and quickly. FDA has approved the use of this material as safe for  
19 food-contact surfaces. The Agency has determined that neither the particles that  
20 may chip off nor the fumes given off at high temperatures pose a health hazard.

21 However, because this nonstick finish may be scratched by sharp or rough-  
22 edged kitchen tools, the manufacturer's recommendations should be consulted  
23 and the use of utensils that may scratch, abrasive scouring pads, or cleaners  
24 avoided.

25 **4-101.19 Nonfood-Contact Surfaces.**

26 Nonfood-contact surfaces of equipment routinely exposed to splash or food  
27 debris are required to be constructed of nonabsorbent materials to facilitate  
28 cleaning. Equipment that is easily cleaned minimizes the presence of  
29 pathogenic organisms, moisture, and debris and deters the attraction of rodents  
30 and insects.

1           **Single-Service                   4-102.11       Characteristics.\***  
2           **and Single-Use**

3           The safety and quality of food can be adversely affected through single service  
4           and single use articles that are not constructed of acceptable materials. The  
5           migration of components of those materials to food they contact could result in  
6           chemical contamination and illness to the consumer. In addition, the use of  
7           unacceptable materials could adversely affect the quality of the food because of  
8           odors, tastes, and colors transferred to the food.

9           **Durability and                   4-201.11       Equipment and Utensils.**  
10          **Strength**

11          Equipment and utensils must be designed and constructed to be durable and  
12          capable of retaining their original characteristics so that such items can  
13          continue to fulfill their intended purpose for the duration of their life expectancy  
14          and to maintain their easy cleanability. If they can not maintain their original  
15          characteristics, they may become difficult to clean, allowing for the  
16          harborage of pathogenic microorganisms, insects, and rodents. Equipment and  
17          utensils must be designed and constructed so that parts do not break and  
18          end up in food as foreign objects or present injury hazards to consumers. A  
19          common example of presenting an injury hazard is the tendency for tines of  
20          poorly designed single service forks to break during use.

21                   **4-201.12       Food Temperature Measuring Devices.\***

22          Food temperature measuring devices that have glass sensors or stems  
23          present a likelihood that glass will end up in food as a foreign object and create  
24          an injury hazard to the consumer. In addition, the contents of the temperature  
25          measuring device, e.g., mercury, may contaminate food or utensils.

26          **Cleanability 4-202.11       Food-Contact Surfaces.\***

27          The purpose of the requirements for multiuse food-contact surfaces is to  
28          ensure that such surfaces are capable of being easily cleaned and accessible  
29          for cleaning. Food-contact surfaces that do not meet these requirements provide  
30          a potential harbor for foodborne pathogenic organisms. Surfaces which have

1 imperfections such as cracks, chips, or pits allow microorganisms to attach and  
2 form biofilms. Once established, these biofilms can release pathogens to food.  
3 Biofilms are highly resistant to cleaning and sanitizing efforts. The requirement  
4 for easy disassembly recognizes the reluctance of food employees to  
5 disassemble and clean equipment if the task is difficult or requires the use of  
6 special, complicated tools.

#### 7 **4-202.12 CIP Equipment.**

8 Certain types of equipment are designed to be cleaned in place (CIP) where it  
9 is difficult or impractical to disassemble the equipment for cleaning. Because  
10 of the closed nature of the system, CIP cleaning must be monitored via access  
11 points to ensure that cleaning has been effective throughout the system.

12 The CIP design must ensure that all food-contact surfaces of the equipment  
13 are contacted by the circulating cleaning and sanitizing solutions. Dead spots  
14 in the system, i.e., areas which are not contacted by the cleaning and sanitizing  
15 solutions, could result in the buildup of food debris and growth of pathogenic  
16 microorganisms. There is equal concern that cleaning and sanitizing solutions  
17 might be retained in the system, which may result in the inadvertent  
18 adulteration of food. Therefore, the CIP system must be self-draining.

#### 19 **4-202.13 “V” Threads, Use Limitation.**

20 V-type threads present a surface which is difficult to clean routinely; therefore,  
21 they are not allowed on food-contact surfaces. The exception provided for hot oil  
22 cooking fryers and filtering systems is based on the high temperatures that  
23 are used in this equipment. The high temperature in effect sterilizes the  
24 equipment, including debris in the “V” threads.

#### 25 **4-202.14 Hot Oil Filtering Equipment.**

26 To facilitate and ensure effective cleaning of this equipment, Code  
27 requirements, §§ 4-202.11 and 4-202.12 must be followed. The filter is designed  
28 to keep the oil free of undesired materials and therefore must be readily  
29 accessible for replacement. Filtering the oil reduces the likelihood that off-  
30 odors, tastes, and possibly toxic compounds may be imparted to food as a result

1 of debris buildup. To ensure that filtering occurs, it is necessary for the filter  
2 to be accessible for replacement.

3 **4-202.15 Can Openers.**

4 Once can openers become pitted or the surface in any way becomes  
5 uncleanable, they must be replaced because they can no longer be adequately  
6 cleaned and sanitized. Can openers must be designed to facilitate  
7 replacement.

8 **4-202.16 Nonfood-Contact Surfaces.**

9 Hard-to-clean areas could result in the attraction and harborage of insects and  
10 rodents and allow the growth of foodborne pathogenic microorganisms. Well-  
11 designed equipment enhances the ability to keep nonfood-contact surfaces  
12 clean.

13 **4-202.17 Kick Plates, Removable.**

14 The use of kick plates is required to allow access for proper cleaning. If kick  
15 plate design and installation does not meet Code requirements, debris could  
16 accumulate and create a situation that may attract insects and rodents.

17 **Accuracy 4-203.11 Temperature Measuring Devices, Food.**

18 The Metric Conversion Act of 1975 (amended 1988, 1996, and 2004, 15 USC  
19 205a et seq) requires that all Federal government regulations use the Celsius  
20 Scale for temperature measurement. The Fahrenheit scale is included in the  
21 Code for those jurisdictions using the Fahrenheit scale for temperature  
22 measurement.

23 The small margin of error specified for thermometer accuracy is due to the lack  
24 of a large safety margin in the temperature requirements themselves. The  
25 accuracy specified for a particular food temperature measuring device is  
26 applicable to its entire range of use, that is, from refrigeration through cooking  
27 temperatures if the device is intended for such use.

1                   **4-203.12     Temperature Measuring Devices, Ambient Air and Water.**

2                   A temperature measuring device used to measure the air temperature in a  
3                   refrigeration unit is not required to be as accurate as a food thermometer  
4                   because the unit's temperature fluctuates with repeated opening and closing of  
5                   the door and because accuracy in measuring internal food temperatures is of  
6                   more significance.

7                   The Celsius scale is the federally recognized scale based on The Metric  
8                   Conversion Act of 1975 (amended 1988, 1996, and 2004, 15 USC 205a et seq)  
9                   which requires the use of metric values. The  $\pm 1.5^{\circ}\text{C}$  requirement is more  
10                  stringent than the  $3^{\circ}\text{F}$  previously required since  $\pm 1.5^{\circ}\text{C}$  is equivalent to  
11                   $\pm 2.7^{\circ}\text{F}$ . The more rigid accuracy results from the practical application of metric  
12                  equivalents to the temperature gradations of Celsius thermometers.

13                 If Fahrenheit thermometers are used, the  $3^{\circ}\text{F}$  requirement applies because of  
14                 the calibrated intervals of Fahrenheit thermometers.

15                 The accuracy specified for a particular air or water temperature measuring  
16                 device is applicable to its intended range of use. For example, a cold holding  
17                 unit may have a temperature measuring device that measures from a  
18                 specified frozen temperature to  $20^{\circ}\text{C}$  ( $68^{\circ}\text{F}$ ). The device must be accurate to  
19                 specifications within that use range.

20                   **4-203.13     Pressure Measuring Devices, Mechanical**  
21                   **Warewashing Equipment.**

22                 Flow pressure is a very important factor with respect to the efficacy of  
23                 sanitization. A pressure below the design pressure results in inadequate spray  
24                 patterns and incomplete coverage of the utensil surfaces to be sanitized.  
25                 Excessive flow pressure will tend to atomize the water droplets needed to  
26                 convey heat into a vapor mist that cools before reaching the surfaces to be  
27                 sanitized.

28                   **Functionality     4-204.11     Ventilation Hood Systems, Drip Prevention.**

29                 The dripping of grease or condensation onto food constitutes adulteration and  
30                 may involve contamination of the food with pathogenic organisms. Equipment,

1 utensils, linens, and single service and single use articles that are subjected to  
2 such drippage are no longer clean.

#### 3 **4-204.12 Equipment Openings, Closures and Deflectors.**

4 Equipment openings and covers must be designed to protect stored or  
5 prepared food from contaminants and foreign matter that may fall into the food.  
6 The requirement for an opening to be flanged upward and for the cover to  
7 overlap the opening and be sloped to drain prevents contaminants, especially  
8 liquids, from entering the food-contact area.

9 Some equipment may have parts that extend into the food-contact areas. If these  
10 parts are not provided with a watertight joint at the point of entry into the food-  
11 contact area, liquids may contaminate the food by adhering to shafts or other  
12 parts and running or dripping into the food.

13 An apron on parts extending into the food-contact area is an acceptable  
14 alternative to the watertight seal. If the apron is not properly designed and  
15 installed, condensation, drips, and dust may gain access to the food.

#### 16 **4-204.13 Dispensing Equipment, Protection of Equipment and Food.**

17 This requirement is intended to protect both the machine-dispensed,  
18 unpackaged, liquid foods and the machine components from contamination.  
19 Barriers need to be provided so that the only liquid entering the food container is  
20 the liquid intended to be dispensed when the machine's mechanism is activated.  
21 Recessing of the machine's components and self-closing doors prevent  
22 contamination of machine ports by people, dust, insects, or rodents. If the  
23 equipment components become contaminated, the product itself will be  
24 exposed to possible contamination.

25 A direct opening into the food being dispensed allows dust, vermin, and other  
26 contaminants access to the food.

#### 27 **4-204.14 Vending Machine, Vending Stage Closure.**

28 Since packaged foods dispensed from vending machines could attract insects  
29 and rodents, a self-closing door is required as a barrier to their entrance.

#### 30 **4-204.15 Bearings and Gear Boxes, Leakproof.**

1 It is not unusual for food equipment to contain bearings and gears. Lubricants  
2 necessary for the operation of these types of equipment could contaminate  
3 food or food-contact surfaces if the equipment is not properly designed and  
4 constructed.

#### 5 **4-204.16 Beverage Tubing, Separation.**

6 Beverage tubing and coldplate cooling devices may result in contamination if  
7 they are installed in direct contact with stored ice. Beverage tubing installed in  
8 contact with ice may result in condensate and drippage contaminating the ice  
9 as the condensate moves down the beverage tubing and ends up in the ice.

10 The presence of beverage tubing and/or coldplate cooling devices also  
11 presents cleaning problems. It may be difficult to adequately clean the ice bin if  
12 they are present. Because of the high moisture environment, mold and algae  
13 may form on the surface of the ice bins and any tubing or equipment stored  
14 in the bins.

#### 15 **4-204.17 Ice Units, Separation of Drains.**

16 Liquid waste drain lines passing through ice machines and storage bins  
17 present a risk of contamination due to potential leakage of the waste lines and  
18 the possibility that contaminants will gain access to the ice through condensate  
19 migrating along the exterior of the lines.

20 Liquid drain lines passing through the ice bin are, themselves, difficult to clean  
21 and create other areas that are difficult to clean where they enter the unit as well  
22 as where they abut other surfaces. The potential for mold and algal growth in  
23 this area is very likely due to the high moisture environment. Molds and  
24 algae that form on the drain lines are difficult to remove and present a risk of  
25 contamination to the ice stored in the bin.

#### 26 **4-204.18 Condenser Unit, Separation.**

27 A dust-proof barrier between a condenser and food storage areas of  
28 equipment protects food and food-contact areas from contamination by dust that  
29 is accumulated and blown about as a result of the condenser's operation.

#### 30 **4-204.19 Can Openers on Vending Machines.**

1 Since the cutting or piercing surfaces of a can opener directly contact food in  
2 The container being opened, these surfaces must be protected from  
3 contamination.

#### 4 **4-204.110 Molluscan Shellfish Tanks.**

5 Shellfish are filter feeders allowing concentration of pathogenic microorganisms  
6 that may be present in the water. Due to the number of shellfish and the  
7 limited volume of water used, display tanks may allow concentration of  
8 pathogenic viruses and bacteria.

9 Since many people eat shellfish either raw or lightly cooked, the potential for  
10 increased levels of pathogenic microorganisms in shellfish held in display tanks  
11 is of concern. If shellfish stored in molluscan shellfish tanks are offered for  
12 consumption, certain safeguards must be in place as specified in a detailed  
13 HACCP plan that is approved by the regulatory authority. Opportunities for  
14 contamination must be controlled or eliminated. Procedures must emphasize  
15 strict monitoring of the water quality of the tank including the filtering and  
16 disinfection system.

#### 17 **4-204.111 Vending Machines, Automatic Shutoff.\***

18 Failure to store potentially hazardous (time/temperature control for safety) food at  
19 safe temperatures in a vending machine could result in the growth of pathogenic  
20 microorganisms that may result in foodborne illness. The presence of an  
21 automatic control that prevents the vending of food if the temperature of the unit  
22 exceeds Code requirements precludes the vending of foods that may not be  
23 safe.

24 It is possible and indeed very likely that the temperature of the storage area  
25 of a vending machine may exceed Code requirements during the stocking and  
26 servicing of the machine. The automatic shut off, commonly referred to as the  
27 “public health control,” provides a limited amount of time that the ambient  
28 temperature of a machine may exceed Code requirements. Strict adherence to  
29 the time requirements can limit the growth of pathogenic microorganisms.

#### 30 **4-204.112 Temperature Measuring Devices.**

1 The placement of the temperature measuring device is important. If the  
2 device is placed in the coldest location in the storage unit, it may not be  
3 representative of the temperature of the unit. Food could be stored in areas of  
4 the unit that exceed Code requirements. Therefore, the temperature measuring  
5 device must be placed in a location that is representative of the actual  
6 storage temperature of the unit to ensure that all potentially hazardous  
7 (time/temperature control for safety) foods are stored at least at the minimum  
8 temperature required in Chapter 3.

9 Installing an air thermometer in some open display refrigerators can be difficult  
10 without physically impairing the usability of the case and interfering with  
11 cleaning and sanitation. Use of a temperature monitoring system that uses probe-  
12 like sensors that are placed in material resembling the density of food is an  
13 acceptable alternative. Thus, the direct temperature of the substitute product is  
14 measured by use of this product mimicking method.

15 A permanent temperature measuring device is required in any unit storing  
16 potentially hazardous (time/temperature control for safety) food because of the  
17 potential growth of pathogenic microorganisms should the temperature of the  
18 unit exceed Code requirements. In order to facilitate routine monitoring of the  
19 unit, the device must be clearly visible.

20 The exception to requiring a temperature measuring device for the types of  
21 equipment listed is primarily due to equipment design and function. It would be  
22 difficult and impractical to permanently mount a temperature measuring device  
23 on the equipment listed. The futility of attempting to measure the temperature of  
24 unconfined air such as with heat lamps and, in some cases, the brief period of  
25 time the equipment is used for a given food negate the usefulness of ambient  
26 temperature monitoring at that point. In such cases, it would be more practical  
27 and accurate to measure the internal temperature of the food.

28 The importance of maintaining potentially hazardous (time/temperature control  
29 for safety) foods at the specified temperatures requires that temperature

1 measuring devices be easily readable. The inability to accurately read a  
2 thermometer could result in food being held at unsafe temperatures.

3 Temperature measuring devices must be appropriately scaled per Code  
4 requirements to ensure accurate readings.

5 The required incremental gradations are more precise for food measuring  
6 devices than for those used to measure ambient temperature because of the  
7 significance at a given point in time, i.e., the potential for pathogenic growth,  
8 versus the unit's temperature. The food temperature will not necessarily match  
9 the ambient temperature of the storage unit; it will depend on many variables  
10 including the temperature of the food when it is placed in the unit, the  
11 temperature at which the unit is maintained, and the length of time the food is  
12 stored in the unit.

13 **4-204.113 Warewashing Machine, Data Plate Operating**  
14 **Specifications.**

15 The data plate provides the operator with the fundamental information needed  
16 to ensure that the machine is effectively washing, rinsing, and sanitizing  
17 equipment and utensils. The warewashing machine has been tested, and the  
18 information on the data plate represents the parameters that ensure effective  
19 operation and sanitization and that need to be monitored.

20 **4-204.114 Warewashing Machines, Internal Baffles.**

21 The presence of baffles or curtains separating the various operational cycles  
22 of a warewashing machine such as washing, rinsing, and sanitizing are  
23 designed to reduce the possibility that solutions from one cycle may  
24 contaminate solutions in another. The baffles or curtains also prevent food  
25 debris from being splashed onto the surface of equipment that has moved to  
26 another cycle in the procedure.

27 **4-204.115 Warewashing Machines, Temperature Measuring Devices.**

28 The requirement for the presence of a temperature measuring device in each  
29 tank of the warewashing machine is based on the importance of temperature  
30 in the sanitization step. In hot water machines, it is critical that minimum

1 temperatures be met at the various cycles so that the cumulative effect of  
2 successively rising temperatures causes the surface of the item being washed  
3 to reach the required temperature for sanitization. When chemical sanitizers are  
4 used, specific minimum temperatures must be met because the effectiveness  
5 of chemical sanitizers is directly affected by the temperature of the solution.

6 **4-204.116 Manual Warewashing Equipment, Heaters and Baskets.**

7 Hot water sanitization is accomplished in water of not less than 77°C (170°F)  
8 and an integral heating device is necessary to ensure that the minimum  
9 temperature is reached.

10 The rack or basket is required in order to safely handle the equipment and  
11 utensils being washed and to ensure immersion. Water at this temperature  
12 could result in severe burns to employees operating the equipment.

13 **4-204.117 Warewashing Machines, Automatic Dispensing of**  
14 **Detergents and Sanitizers.**

15 The presence of adequate detergents and sanitizers is necessary to effect  
16 clean and sanitized utensils and equipment. The automatic dispensing of these  
17 chemical agents, plus a method such as a flow indicator, flashing light, buzzer,  
18 or visible open air delivery system that alerts the operator that the chemicals are  
19 no longer being dispensed, ensures that utensils are subjected to an efficacious  
20 cleaning and sanitizing regimen.

21 **4-204.118 Warewashing Machines, Flow Pressure Device.**

22 Flow pressure is a very important factor impacting the efficacy of sanitization in  
23 machines that use fresh hot water at line-pressure as a final sanitization rinse.  
24 (See discussion in Public Health Reason for section 4-203.13.) It is important  
25 that the operator be able to monitor, and the food inspector be able to check,  
26 final sanitization rinse pressure as well as machine water temperatures.  
27 ANSI/NSF Standard #3, a national voluntary consensus standard for Commercial  
28 Spray-Type Dishwashing Machines, specifies that a pressure gauge or  
29 similar device be provided on this type machine and such devices are shipped  
30 with machines by the manufacturer. Flow pressure devices installed on the

1 upstream side of the control (solenoid) valve are subject to damage and failure  
2 due to the water hammer effect caused throughout the dishwashing period  
3 each time the control valve closes. The IPS valve provides a ready means for  
4 checking line-pressure with an alternative pressure measuring device. A flow  
5 pressure device is not required on machines that use only a pumped or  
6 recirculated sanitizing rinse since an appropriate pressure is ensured by a pump  
7 and is not dependent upon line-pressure.

#### 8 **4-204.121 Vending Machines, Liquid Waste Products.**

9 The presence of internal waste containers allows for the collection of liquids  
10 that spill within the vending machine. Absence of a waste container or, where  
11 required, a shutoff valve which controls the incoming liquids could result in  
12 wastes spilling within the machine, causing a condition that attracts insects and  
13 rodents and compounds cleaning and maintenance problems.

#### 14 **4-204.122 Case Lot Handling Equipment, Moveability.**

15 Proper design of case lot handling equipment facilitates moving case lots for  
16 cleaning and for surveillance of insect or rodent activity.

#### 17 **4-204.123 Vending Machine Doors and Openings.**

18 The objective of this requirement is to provide a barrier against the entrance into  
19 vending machines of insects, rodents, and dust. The maximum size of the  
20 openings deters the entrance of common pests.

#### 21 **Acceptability 4-205.10 Food Equipment, Certification and** 22 **Classification.**

23 Under ANSI document CA-1 ANSI Policy and Criteria for Accreditation of  
24 Certification Programs, it has been stipulated that:

25 “For food equipment programs, standards that establish sanitation requirements  
26 shall be specified government standards or standards that have been ratified by  
27 a public health approval step. ANSI shall verify that this requirement has been  
28 met by communicating with appropriate standards developing organizations and  
29 governmental public health bodies.”

30 The term certified is used when an item of food equipment has been evaluated

1 against an organization's own standard. The term classified is used when one  
2 organization evaluates an item of food equipment against a standard  
3 developed by another organization.

4 **Equipment 4-301.11 Cooling, Heating, and Holding Capacities.**

5 The ability of equipment to cool, heat, and maintain potentially hazardous  
6 (time/temperature control for safety) foods at Code-required temperatures is  
7 critical to food safety. Improper holding and cooking temperatures continue to be  
8 major contributing factors to foodborne illness. Therefore, it is very important  
9 to have adequate hot or cold holding equipment with enough capacity to meet  
10 the heating and cooling demands of the operation.

11 **4-301.12 Manual Warewashing, Sink Compartment Requirements.**

12 The 3 compartment requirement allows for proper execution of the 3-step  
13 manual warewashing procedure. If properly used, the 3 compartments reduce  
14 the chance of contaminating the sanitizing water and therefore diluting the  
15 strength and efficacy of the chemical sanitizer that may be used.

16 Alternative manual warewashing equipment, allowed under certain  
17 circumstances and conditions, must provide for accomplishment of the same 3  
18 steps:

- 19 1. Application of cleaners and the removal of soil;
- 20 2. Removal of any abrasive and removal or dilution of cleaning  
21 chemicals; and
- 22 3. Sanitization.

23 Refer also to the public health reason for § 4-603.16.

24 **4-301.13 Drainboards.**

25 Drainboards or equivalent equipment are necessary to separate soiled and  
26 cleaned items from each other and from the food preparation area in order to  
27 preclude contamination of cleaned items and of food.

28 Drainboards allow for the control of water running off equipment and utensils that  
29 have been washed and also allow the operator to properly store washed  
30 equipment and utensils while they air-dry.

1                                   **4-301.14     Ventilation Hood Systems, Adequacy.**

2           If a ventilation system is inadequate, grease and condensate may build up on  
3           the floors, walls and ceilings of the food establishment, causing an insanitary  
4           condition and possible deterioration of the surfaces of walls and ceilings. The  
5           accumulation of grease and condensate may contaminate food and food-contact  
6           surfaces as well as present a possible fire hazard.

7           Refer also to the public health reason for § 4-204.11.

8                                   **4-301.15     Clothes Washers and Dryers.**

9           To protect food, soiled work clothes or linens must be efficiently laundered.  
10          The only practical way of efficiently laundering work clothes on the premises is  
11          with the use of a mechanical washer and dryer.

12          Refer also to the public health reason for § 4-401.11.

13                   **Utensils,           4-302.11     Utensils, Consumer Self-Service.**

14                   ***Temperature***

15                   ***Measuring Devices, and***

16                   ***Testing Devices***

17          Appropriate serving utensils provided at each container will, among other  
18          things, reduce the likelihood of food tasting, use of fingers to serve food, use of  
19          fingers to remove the remains of one food on the utensil so that it may be used  
20          for another, use of soiled tableware to transfer food, and cross contamination  
21          between foods, including a raw food to a cooked potentially hazardous  
22          (time/temperature control for safety) food.

23                   **4-302.12     Food Temperature Measuring Devices.**

24          The presence and accessibility of food temperature measuring devices is  
25          critical to the effective monitoring of food temperatures. Proper use of such  
26          devices provides the operator or person in charge with important information  
27          with which to determine if temperatures should be adjusted or if foods should  
28          be discarded.

29          When determining the temperature of thin foods, those having a thickness less  
30          than 13 mm (1/2 inch), it is particularly important to use a temperature sensing

1 probe designed for that purpose. Bimetal, bayonet style thermometers are not  
2 suitable for accurately measuring the temperature of thin foods such as  
3 hamburger patties because of the large diameter of the probe and the inability  
4 to accurately sense the temperature at the tip of the probe. However,  
5 temperature measurements in thin foods can be accurately determined using a  
6 small-diameter probe 1.5 mm (0.059 inch), or less, connected to a device such as  
7 thermocouple thermometer.

8 **4-302.13 Temperature Measuring Devices, Manual**  
9 **Warewashing.**

10 Water temperature is critical to sanitization in warewashing operations. This is  
11 particularly true if the sanitizer being used is hot water. The effectiveness of  
12 cleaners and chemical sanitizers is also determined by the temperature of the  
13 water used. A temperature measuring device is essential to monitor manual  
14 warewashing and ensure sanitization.

15 **4-302.14 Sanitizing Solutions, Testing Devices.**

16 Testing devices to measure the concentration of sanitizing solutions are  
17 required for 2 reasons:

- 18 1. The use of chemical sanitizers requires minimum concentrations  
19 of the sanitizer during the final rinse step to ensure sanitization;  
20 and
- 21 2. Too much sanitizer in the final rinse water could be toxic.

22 **Location 4-401.11 Equipment, Clothes Washers and Dryers, and**  
23 **Storage Cabinets, Contamination Prevention.**

24 Food equipment and the food that contacts the equipment must be protected from  
25 sources of overhead contamination such as leaking or ruptured water or sewer  
26 pipes, dripping condensate, and falling objects. When equipment is installed, it  
27 must be situated with consideration of the potential for contamination from such  
28 overhead sources.

1 If a clothes washer and dryer are installed adjacent to exposed food, clean  
2 equipment, utensils, linens, and unwrapped single-service and single-use  
3 articles, it could result in those items becoming contaminated from soiled  
4 laundry. The reverse is also true, i.e., items being laundered could become  
5 contaminated from the surrounding area if the washer and dryer are not  
6 properly located.

7 **Installation 4-402.11 Fixed Equipment, Spacing or Sealing.**

8 This section is designed to ensure that fixed equipment is installed in a way  
9 that:

- 10 1. Allows accessibility for cleaning on all sides, above, and  
11 underneath the units or minimizes the need for cleaning due to  
12 closely abutted surfaces;
- 13 2. Ensures that equipment that is subject to moisture is sealed;
- 14 3. Prevents the harborage of insects and rodents; and
- 15 4. Provides accessibility for the monitoring of pests.

16 **4-402.12 Fixed Equipment, Elevation or Sealing.**

17 The inability to adequately or effectively clean areas under equipment could  
18 create a situation that may attract insects and rodents and accumulate  
19 pathogenic microorganisms that are transmissible through food.

20 The effectiveness of cleaning is directly affected by the ability to access all areas  
21 to clean fixed equipment. It may be necessary to elevate the equipment. When  
22 elevating equipment is not feasible or prohibitively expensive, sealing to prevent  
23 contamination is required.

24 The economic impact of the requirement to elevate display units in retail food  
25 stores, coupled with the fact that the design, weight, and size of such units are  
26 not conducive to casters or legs, led to the exception for certain units located  
27 in consumer shopping areas, provided the floor under the units is kept clean.  
28 This exception for retail food store display equipment including shelving,  
29 refrigeration, and freezer units in the consumer shopping areas requires a  
30 rigorous cleaning schedule.

1           **Equipment 4-501.11      Good Repair and Proper Adjustment.**

2           Proper maintenance of equipment to manufacturer specifications helps ensure  
3           that it will continue to operate as designed.    Failure to properly maintain  
4           equipment could lead to violations of the associated requirements of the Code  
5           that place the health of the consumer at risk.  For example, refrigeration units in  
6           disrepair may no longer be capable of properly cooling or holding potentially  
7           hazardous (time/temperature control for safety) foods at safe temperatures.

8           The cutting or piercing parts of can openers may accumulate metal fragments  
9           that could lead to food containing foreign objects and, possibly, result in  
10          consumer injury.

11          Adequate cleaning and sanitization of dishes and utensils using a warewashing  
12          machine is directly dependent on the exposure time during the wash, rinse, and  
13          sanitizing cycles.  Failure to meet manufacturer and Code requirements for cycle  
14          times could result in failure to clean and sanitize.  For example, high temperature  
15          machines depend on the buildup of heat on the surface of dishes to accomplish  
16          sanitization.  If the exposure time during any of the cycles is not met, the  
17          surface of the items may not reach the time-temperature parameter required  
18          for sanitization.  Exposure time is also important in warewashing machines that  
19          use a chemical sanitizer since the sanitizer must contact the items long enough  
20          for sanitization to occur.  In addition, a chemical sanitizer will not sanitize a dirty  
21          dish; therefore, the cycle times during the wash and rinse phases are critical to  
22          sanitization.

1 **4-501.12 Cutting Surfaces.**

2 Cutting surfaces such as cutting boards and blocks that become scratched and  
3 scored may be difficult to clean and sanitize. As a result, pathogenic  
4 microorganisms transmissible through food may build up or accumulate. These  
5 microorganisms may be transferred to foods that are prepared on such  
6 surfaces.

7 **4-501.13 Microwave Ovens.**

8 Failure of microwave ovens to meet the CFR standards could result in human  
9 exposure to radiation leakage, resulting in possible medical problems to  
10 consumers and employees using the machines.

11 **4-501.14 Warewashing Equipment, Cleaning Frequency.**

12 With the passage of the Food Quality Protection Act of 1996 and the related  
13 Antimicrobial Regulation Technical Correction Act of 1998, federal regulatory  
14 responsibility for chemical hard surface sanitizers was moved from FDA  
15 (CFSAN/OFAS) to EPA (Office of Pesticides Programs, Antimicrobial Division).  
16 As a result, the relevant Federal regulation has moved from 21 CFR 178.1010  
17 to 40 CFR 180.940.

18 During operation, warewashing equipment is subject to the accumulation of  
19 food wastes and other soils or sources of contamination. In order to ensure the  
20 proper cleaning and sanitization of equipment and utensils, it is necessary to  
21 clean the surface of warewashing equipment before use and periodically  
22 throughout the day.

23 With respect to chemical sanitization, section 4-501.114 addresses the proper  
24 make-up of the sanitizing solution, i.e., chemical concentration, pH, and  
25 temperature at the required minimum levels specified when considered together  
26 and, with respect to quaternary ammonium compounds (quats), the maximum  
27 hardness level. If these minimums (maximum hardness) are not as specified,  
28 then this provision is violated.

29 By contrast, paragraph 4-703.11(C) addresses exposure time in seconds. For  
30 chemical sanitization, this paragraph is only violated when the specified

1 exposure time is not met.

2 Section 7-204.11 addresses two additional considerations. The first is whether  
3 or not the chemical agent being applied as a sanitizer is approved and listed for  
4 that use under 40 CFR 180.940. If the chemical used is not thus listed, this  
5 section is violated.

6 The second consideration under this section is whether the product, if approved  
7 and listed, is being used in accordance with the “Limits” provided for that  
8 product under its 40 CFR 180.940 listing. The concern here is an indirect food  
9 additives concern, since chemical sanitizing solutions are not rinsed off in this  
10 country. For example, 40 CFR 180.940(a) lists several quaternary ammonium  
11 compounds as approved for “food-contact surfaces in public eating places,  
12 dairy-processing equipment, and food-processing equipment and utensils,” each  
13 listing adding a Limit that states, “When ready for use, the end-use  
14 concentration of all quaternary chemicals in the solution is not to exceed  
15 200 ppm of active quaternary compound. If a sanitarian determined that a solution  
16 of any of these quats was at 600 ppm, section 7-204.11 would be violated.

17 To summarize, a too weak sanitizing solution would be a violation of section  
18 4- 501.114. A too strong solution would be a violation of section 7-204.11.  
19 Section 7-202.12 would not be violated due to the existence of section 7-204.11  
20 that specifically addresses the use chemical sanitizers.

21 **4-501.15 Warewashing Machines, Manufacturers'**  
22 **Operating Instructions.**

23 To ensure properly cleaned and sanitized equipment and utensils, warewashing  
24 machines must be operated properly. The manufacturer affixes a data plate to  
25 the machine providing vital, detailed instructions about the proper operation of  
26 the machine including wash, rinse, and sanitizing cycle times and  
27 temperatures which must be achieved.

28 **4-501.16 Warewashing Sinks, Use Limitation.**

29 If the wash sink is used for functions other than warewashing, such as washing  
30 wiping cloths or washing and thawing foods, contamination of equipment and

1 utensils could occur.

2 **4-501.17 Warewashing Equipment, Cleaning Agents.**

3 Failure to use detergents or cleaners in accordance with the manufacturer's  
4 label instructions could create safety concerns for the employee and consumer.  
5 For example, employees could suffer chemical burns, and chemical residues  
6 could find their way into food if detergents or cleaners are used carelessly.  
7 Equipment or utensils may not be cleaned if inappropriate or insufficient  
8 amounts of cleaners or detergents are used.

9 **4-501.18 Warewashing Equipment, Clean Solutions.**

10 Failure to maintain clean wash, rinse, and sanitizing solutions adversely affects  
11 the warewashing operation. Equipment and utensils may not be sanitized,  
12 resulting in subsequent contamination of food.

13 **4-501.19 Manual Warewashing Equipment, Wash Solution Temperature.**

14 The wash solution temperature required in the Code is essential for removing  
15 organic matter. If the temperature is below 110°F, the performance of the  
16 detergent may be adversely affected, e.g., animal fats that may be present  
17 on the dirty dishes would not be dissolved.

18 **4-501.110 Mechanical Warewashing Equipment, Wash**  
19 **Solution Temperature.**

20 The wash solution temperature in mechanical warewashing equipment is  
21 critical to proper operation. The chemicals used may not adequately perform  
22 their function if the temperature is too low. Therefore, the manufacturer's  
23 instructions must be followed. The temperatures vary according to the specific  
24 equipment being used.

1                   **4-501.111    Manual Warewashing Equipment, Hot Water**  
2                   **Sanitization Temperatures.\***

3           If the temperature during the hot water sanitizing step is less than 77°C  
4           (171°F), sanitization will not be achieved. As a result, pathogenic organisms  
5           may survive and be subsequently transferred from utensils to food.

6           **4-501.112    Mechanical Warewashing Equipment, Hot Water Sanitization**  
7           **Temperatures.**

8           The temperature of hot water delivered from a warewasher sanitizing rinse  
9           manifold must be maintained according to the equipment manufacturer's  
10          specifications and temperature limits specified in this section to ensure surfaces  
11          of multiuse utensils such as kitchenware and tableware accumulate enough  
12          heat to destroy pathogens that may remain on such surfaces after cleaning.

13          The surface temperature must reach at least 71°C (160°F) as measured by an  
14          irreversible registering temperature measuring device to affect sanitization.  
15          When the sanitizing rinse temperature exceeds 90°C (194°F) at the manifold,  
16          the water becomes volatile and begins to vaporize reducing its ability to  
17          convey sufficient heat to utensil surfaces. The lower temperature limits of 74°C  
18          (165°F) for a stationary rack, single temperature machine, and 82°C (180°F)  
19          for other machines are based on the sanitizing rinse contact time required  
20          to achieve the 71°C (160°F) utensil surface temperature.

21          **4-501.113    Mechanical Warewashing Equipment, Sanitization Pressure.**

22          If the flow pressure of the final sanitizing rinse is less than that required,  
23          dispersion of the sanitizing solution may be inadequate to reach all surfaces  
24          of equipment or utensils.

25          **4-501.114    Manual and Mechanical Warewashing Equipment, Chemical**  
26          **Sanitization - Temperature, pH, Concentration, and Hardness.\***

27          With the passage of the Food Quality Protection Act of 1996 and the related  
28          Antimicrobial Regulation Technical Correction Act of 1998, Federal regulatory  
29          responsibility for chemical hard surface sanitizers was moved from FDA  
30          (CFSAN/OFAS) to EPA (Office of Pesticides Programs, Antimicrobial Division).

1 As a result, the relevant Federal regulation has moved from 21 CFR 178.1010  
2 to 40 CFR 180.940.

3 The effectiveness of chemical sanitizers can be directly affected by the  
4 temperature, pH, concentration of the sanitizer solution used, and hardness of  
5 the water. All sanitizers approved for use under 40 CFR 180.940 must be used  
6 under water conditions stated on the label to ensure efficacy. Therefore, it is  
7 critical to sanitization that the sanitizers are used properly and the solutions  
8 meet the minimum standards required in the Code.

9 With respect to chemical sanitization, section 4-501.114 addresses the proper  
10 make-up of the sanitizing solution, i.e., chemical concentration, pH, and  
11 temperature at the required maximum levels specified when considered  
12 together and, with respect to quaternary ammonium compounds (quats), the  
13 maximum hardness level. If these minimums (maximum hardness) are not as  
14 specified, then this provision is violated.

15 By contrast, paragraph 4-703.11(C) addresses exposure time in seconds. For  
16 chemical sanitization, this paragraph is only violated when the specified  
17 exposure time is not met.

18 Section 7-204.11 addresses two additional considerations. The first is whether or  
19 not the chemical agent being applied as a sanitizer is approved and listed for  
20 that use under 40 CFR 180.940. If the chemical used is not thus listed, this  
21 section is violated.

22 The second consideration under this section is whether the product, if  
23 approved and listed, is being used in accordance with the “Limits” provided  
24 for that product under its 40 CFR 180.940 listing. The concern here is an  
25 indirect food additives concern, since chemical sanitizing solutions are not rinsed  
26 off in this country. For example, 40 CFR 180.940(a) lists several quaternary  
27 ammonium compounds as approved for “food-contact surfaces in public  
28 eating places, dairy-processing equipment, and food-processing equipment  
29 and utensils,” each listing adding a Limit that states, “When ready for use, the  
30 end-use concentration of all quaternary chemicals in the solution is not to

1 exceed 200 ppm of active quaternary compound.” If a sanitarian determined  
2 that a solution of any of these quats was at 600 ppm, section 7-204.11 would  
3 be violated.

4 To summarize, a too weak sanitizing solution would be a violation of section 4-  
5 501.114. A too strong solution would be a violation of section 7-204.11. Section  
6 7-202.12 would not be violated due to the existence of section 7-204.11 that  
7 specifically addresses the use chemical sanitizers.

8 **4-501.115 Manual Warewashing Equipment, Chemical**  
9 **Sanitization Using Detergent-Sanitizers.**

10 Some chemical sanitizers are not compatible with detergents when a 2 compartment  
11 operation is used. When using a sanitizer that is different from the detergent-  
12 sanitizer of the wash compartment, the sanitizer may be inhibited by carry-  
13 over, resulting in inadequate sanitization.

14 **4-501.116 Warewashing Equipment, Determining Chemical Sanitizer**  
15 **Concentration.**

16 The effectiveness of chemical sanitizers is determined primarily by the  
17 concentration and pH of the sanitizer solution. Therefore, a test kit is  
18 necessary to accurately determine the concentration of the chemical sanitizer  
19 solution.

20 ***Utensils and* 4-502.11 *Good Repair and Calibration.***  
21 ***Temperature***  
22 ***and Pressure***  
23 ***Measuring Devices***

24 A utensil or food temperature measuring device can act as a source of  
25 contamination to the food it contacts if it is not maintained in good repair.  
26 Also, if temperature or pressure measuring devices are not maintained in good  
27 repair, the accuracy of the readings is questionable. Consequently, a  
28 temperature problem may not be detected, or conversely, a corrective action  
29 may be needlessly taken.

30 **4-502.12 Single-Service and Single-Use Articles, Required Use.\***

1 In situations in which the reuse of multiuse items could result in foodborne illness  
2 to consumers, single-service and single-use articles must be used to ensure  
3 safety.

4 **4-502.13 Single-Service and Single-Use Articles, Use**  
5 **Limitation.**

6 Articles that are not constructed of multiuse materials may not be reused as  
7 they are unable to withstand the rigors of multiple uses, including the ability to  
8 be subjected to repeated washing, rinsing, and sanitizing.

9 **4-502.14 Shells, Use Limitation.**

10 The reuse of mollusk and crustacean shells as multiuse utensils is not allowed  
11 in food establishments. This prohibition does not apply to the removal of the  
12 oyster or other species from the shell for preparation, then returning the same  
13 animal to the same shell for service.

14 The shell itself may be potentially unsafe for use as a food utensil because of  
15 residues from natural and environmental contamination occurring after the  
16 mollusk or crustacean is removed. In addition, natural shells are not durable or  
17 easily cleanable as specified under section 4-502.13. When mollusk or  
18 crustacean shells (from commercial sources) are re-used by filling them with  
19 shucked shellfish, the food is considered misleading and not honestly  
20 presented.

21 **Objective 4-601.11 Equipment, Food-Contact Surfaces, Nonfood-**  
22 **Contact Surfaces, and Utensils.\***

23 The objective of cleaning focuses on the need to remove organic matter from  
24 food-contact surfaces so that sanitization can occur and to remove soil from  
25 nonfood contact surfaces so that pathogenic microorganisms will not be allowed  
26 to accumulate and insects and rodents will not be attracted.

27 **Frequency 4-602.11 Equipment Food-Contact Surfaces and Utensils.\***

28 Microorganisms may be transmitted from a food to other foods by utensils,  
29 cutting boards, thermometers, or other food-contact surfaces. Food-contact  
30 surfaces and equipment used for potentially hazardous (time/temperature control

1 for safety) foods should be cleaned as needed throughout the day but must  
2 be cleaned no less than every 4 hours to prevent the growth of  
3 microorganisms on those surfaces.

4 Refrigeration temperatures slow down the generation time of bacterial  
5 pathogens, making it unnecessary to clean every four hours. However, the time  
6 period between cleaning equipment and utensils may not exceed 24 hours. A  
7 time-temperature chart is provided in subparagraph 4-602.11(D)(2) to  
8 accommodate operations that use equipment and utensils in a refrigerated  
9 room or area that maintains a temperature between 41°F or less and 55°F.  
10 Surfaces of utensils and equipment contacting food that is not potentially  
11 hazardous (time/temperature control for safety food) such as iced tea  
12 dispensers, carbonated beverage dispenser nozzles, beverage dispensing  
13 circuits or lines, water vending equipment, coffee bean grinders, ice makers,  
14 and ice bins must be cleaned on a routine basis to prevent the development  
15 of slime, mold, or soil residues that may contribute to an accumulation of  
16 microorganisms. Some equipment manufacturers and industry associations, e.g.,  
17 within the tea industry, develop guidelines for regular cleaning and sanitizing of  
18 equipment. If the manufacturer does not provide cleaning specifications for  
19 food-contact surfaces of equipment that are not readily visible, the person in  
20 charge should develop a cleaning regimen that is based on the soil that may  
21 accumulate in those particular items of equipment.

22 Regarding the possible adulteration from one species of meat to another  
23 between cleaning of food-contact surfaces, USDA/FSIS does not automatically  
24 consider species adulteration as a health hazard. FSIS stated in an Advance  
25 Notice of Proposed Rulemaking that species adulteration falls into a gray area  
26 between safety and economic adulteration (65 FR 14486, March 17, 2000,  
27 Other Consumer Protection Activities). FSIS will review public comments  
28 received on the species adulteration issue and further review the scientific  
29 literature and risk assessment mechanisms before declaring species  
30 adulteration a health hazard. Meanwhile, species adulteration is generally

1 considered by FSIS as an economic issue. However, investigations by FSIS  
2 of species adulteration incidents may include a determination regarding the  
3 impact of species adulteration as a health hazard on a case-by-case basis.

4 **4-602.12 Cooking and Baking Equipment.**

5 Food-contact surfaces of cooking equipment must be cleaned to prevent  
6 encrustations that may impede heat transfer necessary to adequately cook  
7 food. Encrusted equipment may also serve as an insect attractant when not in  
8 use. Because of the nature of the equipment, it may not be necessary to  
9 clean cooking equipment as frequently as the equipment specified in § 4-  
10 602.11.

11 **4-602.13 Nonfood-Contact Surfaces.**

12 The presence of food debris or dirt on nonfood contact surfaces may  
13 provide a suitable environment for the growth of microorganisms which employees  
14 may inadvertently transfer to food. If these areas are not kept clean, they  
15 may also provide harborage for insects, rodents, and other pests.

16 **Methods 4-603.11 Dry Cleaning.**

17 Dry cleaning methods are indicated in only a few operations, which are  
18 limited to dry foods that are not potentially hazardous (time/temperature control  
19 for safety foods). Under some circumstances, attempts at wet cleaning may  
20 create microbiological concerns.

21 **4-603.12 Precleaning.**

22 Precleaning of utensils, dishes, and food equipment allows for the removal of  
23 grease and food debris to facilitate the cleaning action of the detergent.  
24 Depending upon the condition of the surface to be cleaned, detergent alone  
25 may not be sufficient to loosen soil for cleaning. Heavily soiled surfaces may  
26 need to be presoaked or scrubbed with an abrasive.

27 **4-603.13 Loading of Soiled Items, Warewashing Machines.**

28 Items to be washed in a warewashing machine must receive unobstructed  
29 exposure to the spray to ensure adequate cleaning. Items which are stacked  
30 or trays which are heavily loaded with silverware cannot receive complete

1 distribution of detergent, water, or sanitizer and cannot be considered to be  
2 clean. **4-603.14 Wet Cleaning.**

3 Because of the variety of cleaning agents available and the many different  
4 types of soil to be removed it is not possible to recommend one cleaning  
5 agent to fit all situations. Each of the different types of cleaners works best  
6 under different conditions (i.e., some work best on grease, some work best in  
7 warm water, others work best in hot water). The specific chemical selected  
8 should be compatible with any other chemicals to be used in the operation  
9 such as a sanitizer or drying agent.

10 **4-603.15 Washing, Procedures for Alternative Manual**  
11 **Warewashing Equipment.**

12 Some pieces of equipment are fixed or too large to be cleaned in a sink.  
13 Nonetheless, cleaning of such equipment requires the application of cleaners  
14 for the removal of soil and rinsing for the removal of abrasive and cleaning  
15 chemicals, followed by sanitization.

16 **4-603.16 Rinsing Procedures.**

17 It is important to rinse off detergents, abrasive, and food debris after the wash  
18 step to avoid diluting or inactivating the sanitizer.

19 **4-603.17 Returnables, Cleaning for Refilling.\***

20 The refilling of consumer-owned beverage containers introduces the possibility  
21 of contamination of the filling equipment or product by improperly cleaned  
22 containers or the improper operation of the equipment. To prevent this  
23 contamination and possible health hazards to the consumer, the refilling of  
24 consumer-owned containers is limited to beverages that are not potentially  
25 hazardous (time/temperature control for safety) foods. Equipment must be  
26 designed to prevent the contamination of the equipment and means must be  
27 provided to clean the containers at the facility.

28 **Objective 4-701.10 Food-Contact Surfaces and Utensils.**

29 Effective sanitization procedures destroy organisms of public health importance  
30 that may be present on wiping cloths, food equipment, or utensils after cleaning,

1 or which have been introduced into the rinse solution. It is important that  
2 surfaces be clean before being sanitized to allow the sanitizer to achieve its  
3 maximum benefit.

4 **Frequency 4-702.11 Before Use After Cleaning.\***

5 Sanitization is accomplished after the warewashing steps of cleaning and  
6 rinsing so that utensils and food-contact surfaces are sanitized before  
7 coming in contact with food and before use.

8 **Methods 4-703.11 Hot Water and Chemical.\***

9 Efficacious sanitization depends on warewashing being conducted within  
10 certain parameters. Time is a parameter applicable to both chemical and hot  
11 water sanitization. The time hot water or chemicals contact utensils or food-  
12 contact surfaces must be sufficient to destroy pathogens that may remain on  
13 surfaces after cleaning. Other parameters, such as rinse pressure, temperature,  
14 and chemical concentration are used in combination with time to achieve  
15 sanitization.

16 When surface temperatures of utensils passing through warewashing machines  
17 using hot water for sanitizing do not reach the required 71°C (160°F), it is  
18 important to understand the factors affecting the decreased surface  
19 temperature. A comparison should be made between the machine manufacturer's  
20 operating instructions and the machine's actual wash and rinse temperatures and  
21 final rinse pressure. The actual temperatures and rinse pressure should be  
22 consistent with the machine manufacturer's operating instructions and within limits  
23 specified in §§ 4-501.112 and 4-501.113.

24 If either the temperature or pressure of the final rinse spray is higher than the  
25 specified upper limit, spray droplets may disperse and begin to vaporize  
26 resulting in less heat delivery to utensil surfaces. Temperatures below the  
27 specified limit will not convey the needed heat to surfaces. Pressures below  
28 the specified limit will result in incomplete coverage of the heat-conveying  
29 sanitizing rinse across utensil surfaces.

1           **Objective 4-801.11 Clean Linens.**

2 Linens that are not free from food residues and other soiling matter may  
3 carry pathogenic microorganisms that may cause illness.

4                           **Frequency 4-802.11 Specifications.**

5 Linens, cloth gloves, and cloth napkins are to be laundered between uses to  
6 prevent the transfer of pathogenic microorganisms between foods or to food-  
7 contact surfaces. The laundering of wet wiping cloths before being used with a  
8 fresh solution of cleanser or sanitizer is designed to reduce the microbiological  
9 load in the cleanser and sanitizer and thereby reduce the possible transfer of  
10 microorganisms to food and nonfood-contact surfaces.

11           **Methods 4-803.11 Storage of Soiled Linens.**

12 Soiled linens may directly or indirectly contaminate food. Proper storage will  
13 reduce the possibility of contamination of food, equipment, utensils, and single-  
14 service and single-use articles.

15                           **4-803.12 Mechanical Washing.**

16 Proper laundering of wiping cloths will significantly reduce the possibility that  
17 pathogenic microorganisms will be transferred to food, equipment, or utensils.

18                           **4-803.13 Use of Laundry Facilities.**

19 Washing and drying items used in the operation of the establishment on the  
20 premises will help prevent the introduction of pathogenic microorganisms into  
21 the environment of the food establishment.

22           **Drying 4-901.11 Equipment and Utensils, Air-Drying Required.**

23 Items must be allowed to drain and to air-dry before being stacked or stored.  
24 Stacking wet items such as pans prevents them from drying and may allow an  
25 environment where microorganisms can begin to grow. Cloth drying of  
26 equipment and utensils is prohibited to prevent the possible transfer of  
27 microorganisms to equipment or utensils.

28                           **4-901.12 Wiping Cloths, Air-Drying Locations.**

29 Cloths that are air-dried must be dried so that they do not drip on food or  
30 utensils and so that the cloths are not contaminated while air-drying.

1           **Lubricating and           4-902.11     Food-Contact Surfaces.**  
2           **Reassembling**

3           Food-contact surfaces must be lubricated in a manner that does not introduce  
4           contaminants to those surfaces.

5                                   **4-902.12     Equipment.**

6           Equipment must be reassembled in a way that food-contact surfaces are not  
7           contaminated.

8           **Storing       4-903.11     Equipment, Utensils, Linens, and Single-**  
9                                   **Service and Single-Use Articles.**

10          Clean equipment and multiuse utensils which have been cleaned and  
11          sanitized, laundered linens, and single-service and single-use articles can become  
12          contaminated before their intended use in a variety of ways such as through  
13          water leakage, pest infestation, or other insanitary condition.

14                                   **4-903.12     Prohibitions.**

15          The improper storage of clean and sanitized equipment, utensils, laundered  
16          linens, and single-service and single-use articles may allow contamination before  
17          their intended use. Contamination can be caused by moisture from absorption,  
18          flooding, drippage, or splash. It can also be caused by food debris, toxic  
19          materials, litter, dust, and other materials. The contamination is often related to  
20          unhygienic employee practices, unacceptable high-risk storage locations, or  
21          improper construction of storage facilities.

22          **Preventing       4-904.11     Kitchenware and Tableware.**

23          **Contamination   4-904.12     Soiled and Clean Tableware.**

24                                   **4-904.13     Preset Tableware.**

25          The presentation or setting of single-service and single-use articles and cleaned  
26          and sanitized utensils shall be done in a manner designed to prevent the  
27          contamination of food- and lip-contact surfaces.

28  
29                                   **Chapter 5 Water, Plumbing, and Waste**

30          **Source       5-101.11     Approved System.\***

1 Water, unless it comes from a safe supply, may serve as a source of  
2 contamination for food, equipment, utensils, and hands. The major concern is that  
3 water may become a vehicle for transmission of disease organisms. Water can  
4 also become contaminated with natural or man-made chemicals. Therefore, for  
5 the protection of consumers and employees, water must be obtained from a source  
6 regulated by law and must be used, transported, and dispensed in a sanitary  
7 manner.

#### 8 **5-101.12 System Flushing and Disinfection.\***

9 During construction, repair, or modification, water systems may become  
10 contaminated with microbes from soil because pipes are installed underground  
11 or by chemicals resulting from soldering and welding. Floods and other  
12 incidents may also cause water to become contaminated. Chemical  
13 contaminants such as oils may also be present on or in the components of the  
14 system. To render the water safe, the system must be properly flushed and  
15 disinfected before being placed into service.

#### 16 **5-101.13 Bottled Drinking Water.\***

17 Bottled water is obtained from a public water system or from a private source  
18 such as a spring or well. Either means of production must be controlled by public  
19 health law to protect the consumer from contaminated water.

#### 20 **Quality 5-102.11 Standards.\***

21 Bacteriological and chemical standards have been developed for public  
22 drinking water supplies to protect public health. All drinking water supplies must  
23 meet standards required by law.

#### 24 **5-102.12 Nondrinking Water.\***

25 Food establishments may use nondrinking water for purposes such as air-  
26 conditioning or fire protection. Nondrinking water is not monitored for  
27 bacteriological or chemical quality or safety as is drinking water. Consequently,  
28 certain safety precautions must be observed to prevent the contamination of  
29 food, drinking water, or food-contact surfaces. Identifying the piping designated  
30 as nondrinking waterlines and inspection for cross connections are examples of

1 safety precautions.

2 **5-102.13 Sampling.**

3 Wells and other types of individual water supplies may become contaminated  
4 through faulty equipment or environmental contamination of ground water.  
5 Periodic sampling is required by law to monitor the safety of the water and to  
6 detect any change in quality. The controlling agency must be able to ascertain  
7 that this sampling program is active and that the safety of the water is in  
8 conformance with the appropriate standards. Laboratory results are only as  
9 accurate as the sample submitted. Care must be taken not to contaminate samples.  
10 Proper sample collection and timely transportation to the laboratory are  
11 necessary to ensure the safety of drinking water used in the establishment.

12 **5-102.14 Sample Report.**

13 The most recent water sampling report must be kept on file to document a  
14 safe water supply.

15 **Quantity and 5-103.11 Capacity.\***  
16 **Availability**

17 Availability of sufficient water is a basic requirement for proper sanitation  
18 within a food establishment. An insufficient supply of safe water will prevent  
19 the proper cleaning of items such as equipment and utensils and of food  
20 employees' hands.

21 Hot water required for washing items such as equipment and utensils and  
22 employees' hands, must be available in sufficient quantities to meet demand  
23 during peak water usage periods. Booster heaters for warewashers that use  
24 hot water for sanitizing are designed to raise the temperature of hot water to a  
25 level that ensures sanitization. If the volume of water reaching the booster  
26 heater is not sufficient or hot enough, the required temperature for sanitization  
27 can not be reached. Manual washing of food equipment and utensils is most  
28 effective when hot water is used. Unless utensils are clean to sight and touch,  
29 they cannot be effectively sanitized.

30 **5-103.12 Pressure.**

1 Inadequate water pressure could lead to situations that place the public health  
2 at risk. For example, inadequate pressure could result in improper  
3 handwashing or equipment operation. Sufficient water pressure ensures that  
4 equipment such as mechanical warewashers operate according to  
5 manufacturer's specifications.

6 ***Distribution,*** **5-104.11** **System.**

7 ***Delivery, and Retention***

8 Inadequate water systems may serve as vehicles for contamination of food or  
9 food- contact surfaces. This requirement is intended to ensure that sufficient  
10 volumes of water are provided from supplies shown to be safe, through a  
11 distribution system which is protected.

12 **5-104.12 Alternative Water Supply.**

13 Water from an approved source can be contaminated if inappropriately  
14 conveyed. Improperly constructed and maintained water mains, pumps, hoses,  
15 connections, and other appurtenances, as well as transport vehicles and  
16 containers, may result in contamination of safe water and render it hazardous  
17 to human health.

18 ***Materials*** **5-201.11** **Approved.\***

19 Plumbing systems and hoses conveying water must be made of approved  
20 materials and be smooth, durable, nonabsorbent, and corrosion-resistant. If  
21 not, the system may constitute a health hazard because unsuitable surfaces  
22 may harbor disease organisms or it may be constructed of materials that may,  
23 themselves, contaminate the water supply.

24 ***Design,*** **5-202.11** **Approved System and Cleanable Fixtures.\***

25 ***Construction,***  
26 ***and Installation***

27 Water within a system will leach minute quantities of materials out of the  
28 components of the system. To make sure none of the leached matter is toxic  
29 or in a form that may produce detrimental effects, even through long-term  
30 use, all materials and components used in water systems must be of an

1 approved type. New or replacement items must be tested and approved  
2 based on current standards.

3 Improperly designed, installed, or repaired water systems can have inherent  
4 deficiencies such as improper access openings, dead spaces, and areas  
5 difficult or impossible to clean and disinfect. Dead spaces allow water  
6 quality to degrade since they are out of the constant circulation of the  
7 system. Fixtures such as warewashing sinks that are not easily cleanable  
8 may lead to the contamination of food products.

9 **5-202.12 Handwashing Facility, Installation.**

10 Warm water is more effective than cold water in removing the fatty soils  
11 encountered in kitchens. An adequate flow of warm water will cause soap to  
12 lather and aid in flushing soil quickly from the hands. ASTM Standards for  
13 testing the efficacy of handwashing formulations specify a water temperature  
14 of  $40^{\circ}\text{C} \pm 2^{\circ}\text{C}$  (100 to 108°F).

15 An inadequate flow or temperature of water may lead to poor handwashing  
16 practices by food employees. A mixing valve or combination faucet is needed  
17 to provide properly tempered water for handwashing. Steam mixing valves  
18 are not allowed for this use because they are hard to control and injury by  
19 scalding is a possible hazard.

20 **5-202.13 Backflow Prevention, Air Gap.\***

21 During periods of extraordinary demand, drinking water systems may develop  
22 negative pressure in portions of the system. If a connection exists between the  
23 system and a source of contaminated water during times of negative pressure,  
24 contaminated water may be drawn into and foul the entire system. Standing  
25 water in sinks, dipper wells, steam kettles, and other equipment may become  
26 contaminated with cleaning chemicals or food residue. To prevent the  
27 introduction of this liquid into the water supply through back siphonage, various  
28 means may be used.

1 The water outlet of a drinking water system must not be installed so that it  
2 contacts water in sinks, equipment, or other fixtures that use water. Providing an  
3 air gap between the water supply outlet and the flood level rim of a plumbing  
4 fixture or equipment prevents contamination that may be caused by backflow.

5 **5-202.14 Backflow Prevention Device, Design Standard.**

6 In some instances an air gap is not practical such as is the case on the lower  
7 rinse arm for the final rinse of warewashers. This arm may become submerged if  
8 the machine drain becomes clogged. If this failure occurs, the machine tank would  
9 fill to the flood level rim, which is above the rinse arm. A backflow prevention  
10 device is used to avoid potential backflow of contaminated water when an air  
11 gap is not practical. The device provides a break to the atmosphere in the  
12 event of a negative pressure within the system. Minerals contained in water and  
13 solid particulate matter carried in water may coat moving parts of the device  
14 or become lodged between them over time. This may render the device  
15 inoperative. To minimize such an occurrence, only devices meeting certain  
16 standards of construction, installation, maintenance, inspection, and testing for  
17 that application may be used. The necessary maintenance can be facilitated by  
18 installing these devices in accessible locations.

19 **5-202.15 Conditioning Device, Design.**

20 Water conditioning devices must be designed for easy disassembly for  
21 servicing so that they can be maintained in a condition that allows them to  
22 perform the function for which they were designed.

23 ***Numbers and* 5-203.11 Handwashing Facilities.\***  
24 ***Capacities***

25 Because handwashing is such an important factor in the prevention of  
26 foodborne illness, sufficient facilities must be available to make handwashing  
27 not only possible, but likely.

28 **5-203.12 Toilets and Urinals.\***

29 Adequate, sanitary toilet facilities are necessary for the proper disposal of  
30 human waste, which carries pathogenic microorganisms, and for preventing

1 the spread of disease by flies and other insects.

2 Toilet facilities must be of sanitary design and kept clean and in good repair to  
3 prevent food contamination and to motivate employees to use sanitary  
4 practices in the establishment.

5 **5-203.13 Service Sink.**

6 Mop water and similar liquid wastes are contaminated with microorganisms  
7 and other filth. Waste water must be disposed of in a sanitary manner that  
8 will not contaminate food or food equipment. A service sink or curbed  
9 cleaning facility with a drain allows for such disposal.

10 **5-203.14 Backflow Prevention Device, When Required.\***

11 The delivery end of hoses attached to hose bibbs on a drinking water line  
12 may be dropped into containers filled with contaminated water or left in  
13 puddles on the floor or in other possible sources of contamination. A backflow  
14 prevention device must be installed on the hose bibb to prevent the back  
15 siphonage of contaminated liquid into the drinking water system during  
16 occasional periods of negative pressure in the water line.

17 **5-203.15 Backflow Prevention Device, Carbonator.\***

18 When carbon dioxide is mixed with water, carbonic acid, a weak acid, is  
19 formed.

20 Carbonators on soft drink dispensers form such acids as they carbonate the  
21 water to be mixed with the syrups to produce the soft drinks. If carbon  
22 dioxide backs up into a copper water line, carbonic acid will dissolve some  
23 of the copper. The water containing the dissolved copper will subsequently  
24 be used in dispensing soft drinks and the first few customers receiving the  
25 drinks are likely to suffer with the symptoms of copper poisoning.

26 An air gap or a vented backflow prevention device meeting ASSE Standard  
27 No. 1022 will prevent this occurrence, thereby reducing incidences of copper  
28 poisoning.

1           **Location and           5-204.11           Handwashing Sinks.\***

2           **Placement**

3           Hands are probably the most common vehicle for the transmission of  
4           pathogens to foods in an establishment. Hands can become soiled with a  
5           variety of contaminants during routine operations. Some employees are  
6           unlikely to wash their hands unless properly equipped handwashing facilities  
7           are accessible in the immediate work area. Facilities which are improperly  
8           located may be blocked by portable equipment or stacked full of soiled utensils  
9           and other items, rendering the facility unavailable for regular employee use.  
10          Nothing must block the approach to a handwashing facility thereby  
11          discouraging its use, and the facility must be kept clean and well stocked  
12          with soap and sanitary towels to encourage frequent use.

13                           **5-204.12           Backflow Prevention Device, Location.**

14          Backflow prevention devices are meant to protect the drinking water system  
15          from contamination caused by backflow. If improperly placed, backflow  
16          prevention devices will not work. If inconveniently located, these devices  
17          may not be accessed when systems are extended, altered, serviced, or  
18          replaced. Over a period of time, unserviced devices may fail and system  
19          contamination may occur.

20                           **5-204.13           Conditioning Device, Location.**

21          When not located for easy maintenance, conditioning devices will be  
22          inconvenient to access and devices such as filters, screens, and water  
23          softeners will become clogged because they are not properly serviced.

24                           **Operation and           5-205.11           Using a Handwashing Sink.**

25           **Maintenance**

26          Facilities must be maintained in a condition that promotes handwashing and  
27          restricted for that use. Convenient accessibility of a handwashing facility  
28          encourages timely handwashing which provides a break in the chain of  
29          contamination from the hands of food employees to food or food-contact  
30          surfaces. Sinks used for food preparation and warewashing can become

1 sources of contamination if used as handwashing facilities by employees  
2 returning from the toilet or from duties which have contaminated their hands.

3 **5-205.12 Prohibiting a Cross Connection.\***

4 Nondrinking water may be of unknown or questionable origin. Waste water is  
5 either known or suspected to be contaminated. Neither of these sources can be  
6 allowed to contact and contaminate the drinking water system.

7 **5-205.13 Scheduling Inspection and Service for a Water System Device.**

8 Water system devices, such as filters and backflow preventers, are affected by  
9 the water in the system. How devices are affected depends on water quality,  
10 especially pH, hardness, and suspended particulate matter in the water.  
11 Complexity of the device is also a factor. Manufacturer recommendations, as  
12 well as inspection and maintenance schedules for these devices, must be  
13 strictly followed to prevent failure during operation.

14 **Cleaning 5-205.14 Water Reservoir of Fogging**  
15 **Devices, Cleaning.\***

16 Water reservoirs that have poor water exchange rates, such as reservoirs for  
17 some humidifiers or aerosol or fogging devices, and that are directly or  
18 indirectly open to the atmosphere, may be contaminated with respiratory  
19 pathogens such as *Legionella pneumophila*. This organism is extremely  
20 infectious and can be transmitted through very small droplets of a fogger or  
21 humidifier. It is important that the manufacturer's cleaning and maintenance  
22 schedule be scrupulously followed to prevent a reservoir from colonization by  
23 this bacterium.

24 **5-205.15 System Maintained in Good Repair.\***

25 Improper repair or maintenance of any portion of the plumbing system may  
26 result in potential health hazards such as cross connections, backflow, or  
27 leakage. These conditions may result in the contamination of food, equipment,  
28 utensils, linens, or single-service or single-use articles. Improper repair or  
29 maintenance may result in the creation of obnoxious odors or nuisances, and  
30 may also adversely affect the operation of warewashing equipment or other

1 equipment which depends on sufficient volume and pressure to perform its  
2 intended functions.

3 **Materials 5-301.11 Approved.**

4 Materials used in the construction of a mobile water tank are affected by the  
5 water they contact. Tank liners may deteriorate and flake. Metals or platings  
6 can be toxic. To prevent the degradation of the quality of the water, it is  
7 important that the materials used in the construction of the tank are suitable  
8 for such use.

9 **Design and 5-302.11 Enclosed System, Sloped to Drain.**

10 **Construction 5-302.12 Inspection and Cleaning Port, Protected and**  
11 **Secured.**

12 The tank must be a closed system from the filling inlet to the outlet to  
13 prevent contamination of water. It is important that the bottom of the tank be  
14 sloped to the outlet to allow the tank to drain completely, to facilitate the  
15 proper cleaning and disinfection of the tank, and to prevent the retention of  
16 water or solutions after cleaning.

17 Some tanks are designed with an access opening to facilitate the cleaning and  
18 servicing of the water tank. The access must be constructed to prevent the  
19 opening from becoming a source of contamination of the water.

20 **5-302.13 "V" Type Threads, Use Limitation.**

21 V-type threads are difficult to clean if contaminated with food or waste. To  
22 prevent the contamination of the drinking water, this type of thread should  
23 only be used on water tank inlets and outlets if the connection is  
24 permanent which eliminates exposed, difficult-to-clean threads.

25 **5-302.14 Tank Vent, Protected.**

26 Water tanks are equipped with a vent to preclude distortion during filling or  
27 draining. The vent should be equipped with a suitable screen or filter to  
28 protect the tank against the entry of insects or other vermin that may  
29 contaminate the water supply.

30 **5-302.15 Inlet and Outlet, Sloped to Drain.**

1 Both the inlet and outlet must be sloped to drain to prevent the pooling of  
2 possibly contaminated water or sanitizing solution.

3 **5-302.16 Hose, Construction and Identification.**

4 Hoses used to fill potable water tanks should be dedicated for that one task  
5 and should be identified for that use only to prevent contaminating the  
6 water. Hoses must be made of a material that will not leach detrimental  
7 substances into the water.

8 **Numbers and 5-303.11 Filter, Compressed Air.**

9 **Capacities**

10 Compressor pistons are lubricated with oil to minimize wear. Some of the oil  
11 is carried into the air lines and if not intercepted may contaminate the tank  
12 and water lines.

13 **5-303.12 Protective Cover or Device.**

14 Protective equipment provided for openings of the water supply must be in  
15 use to prevent contamination which may be present where the supply is  
16 exposed to the environment, i.e., at water inlets or outlets or the ends of  
17 transfer hoses.

18 **5-303.13 Mobile Food Establishment Tank Inlet.**

19 Mobile units may be particularly vulnerable to environmental contamination if  
20 soiled hose connections are coupled to the tank inlet.

21 **Operation and 5-304.11 System Flushing and Disinfection.\***

22 **Maintenance**

23 Contaminants of various types may be introduced into a water system during  
24 construction or repair or other incidents. The system must be flushed and  
25 sanitized after maintenance and before it is placed into service to prevent  
26 contamination of the water introduced into the tank.

1                   **5-304.12     Using a Pump and Hoses, Backflow Prevention.**

2           When a water system includes a pump, or a pump is used in filling a water  
3           tank, care must be taken during hookup to prevent negative pressure on the  
4           supplying water system. Backflow prevention to protect the water supply is  
5           especially necessary during cleaning and sanitizing operations on a mobile  
6           system.

7                   **5-304.13     Protecting Inlet, Outlet, and Hose Fitting.**

8           When not connected for use, water inlets, outlets, and hose fittings should be  
9           closed to the environment. Unless capped or otherwise protected, filling inlets,  
10          outlets, and hoses may become contaminated by dust or vermin.

11                  **5-304.14     Tank, Pump, and Hoses, Dedication.**

12          Hoses, pumps, and tanks used for food or water may not be used for other  
13          liquids because this may contaminate the water supply. If a hose, tank, or pump  
14          has been used to transfer liquid food, the equipment must be cleaned and  
15          sanitized before using it for water delivery. Failure to properly clean and sanitize  
16          the equipment would introduce nutrients, and possibly bacteria, into the water  
17          as well as inactivate residual chlorine from public water supplies.

18    **Mobile                   5-401.11     Capacity and Drainage.**

1       ***Holding Tank***

2       Liquid waste from a mobile or temporary food establishment must be stored  
3       in a properly constructed waste tank to discourage the attraction of flies and  
4       other vermin. The waste tank must be 15% larger than the water storage  
5       tank to allow for storage of wastes and used water from the drinking water  
6       supply tank. The drain from the waste tank must be larger than the filling  
7       hose to prevent the use of the drinking water filling hose to drain the waste  
8       tank.

9       ***Retention,                      5-402.10      Establishment Drainage System.***

10      ***Drainage, and***

11      ***Delivery***

12      The drainage system must be designed and installed properly to prevent the  
13      backup of sewage and the possible contamination of foods or food-contact  
14      surfaces in the establishment.

15                      **5-402.11      Backflow Prevention.\***

16      Improper plumbing installation or maintenance may result in potential health  
17      hazards such as cross connections, back siphonage or backflow. These  
18      conditions may result in the contamination of food, utensils, equipment, or other  
19      food-contact surfaces. It may also adversely affect the operation of equipment  
20      such as warewashing machines.

21      The exception in paragraph 5-402.11(B) allows for a direct connection to the  
22      sanitary sewer system for floor drains originating in refrigerated spaces that  
23      are constructed as an integral part of the building structure. Examples of  
24      refrigerated spaces that are considered an integral part of the building include  
25      refrigerated prep rooms, meat cutting rooms, and refrigerated storage rooms.  
26      The exception specifically targets refrigerated spaces that are considered an  
27      integral part of the building. It does not apply to prefabricated walk-in  
28      refrigerators and freezers with prefabricated floors. It is not intended to apply  
29      to pieces of equipment, including those which may be located in a

1 refrigerated room and which indirectly drain to a floor drain within the room.  
2 Drainage from equipment is addressed under paragraph 5-402.11(A).

3 **5-402.12 Grease Trap.**

4 Failure to locate a grease trap so that it can be properly maintained and  
5 cleaned could result in the harborage of vermin and/or the failure of the  
6 sewage system.

7 **5-402.13 Conveying Sewage.\***

8 **5-402.14 Removing Mobile Food Establishment Waste.**

9 Improper disposal of waste provides a potential for contamination of food,  
10 utensils, and equipment and, therefore, may cause serious illness or disease  
11 outbreaks. Proper removal is required to prevent contamination of ground  
12 surfaces and water supplies, or creation of other insanitary conditions that may  
13 attract insects and other vermin.

14 **5-402.15 Flushing a Waste Retention Tank.**

15 Thoroughly flushing the liquid waste retention tank will prevent the buildup of  
16 deposits within the tank which could affect the proper operation of the tank.

17 ***Disposal* 5-403.11 Approved Sewage Disposal System.\***

18 ***Facility***

19 Many diseases can be transmitted from one person to another through fecal  
20 contamination of food and water. This transmission can be indirect. Proper  
21 disposal of human wastes greatly reduces the risk of fecal contamination. This  
22 Code provision is intended to ensure that wastes will not contaminate ground  
23 surfaces or water supplies; pollute surface waters; be accessible to children or  
24 pets; or allow rodents or insects to serve as vectors of disease from this  
25 source.

26 **5-403.12 Other Liquid Waste and Rainwater.**

27 Liquid food wastes and rainwater can provide a source of bacterial  
28 contamination and support populations of pests. Proper storage and disposal  
29 of wastes and drainage of rainwater eliminate these conditions.

30 ***Facilities* 5-501.10 Indoor Storage Area.**

1	<b>on</b>	<b>5-501.11</b>	<b>Outdoor Storage Surface.</b>
2	<b>the Premises</b>	<b>5-501.12</b>	<b>Outdoor Enclosure.</b>
3		<b>5-501.13</b>	<b>Receptacles.</b>
4		<b>5-501.14</b>	<b>Receptacles in Vending Machines.</b>
5		<b>5-501.15</b>	<b>Outside Receptacles.</b>
6		<b>5-501.16</b>	<b>Storage Areas, Rooms, and Receptacles,</b>
7			<b>Capacity and Availability.</b>
8		<b>5-501.17</b>	<b>Toilet Room Receptacle, Covered.</b>
9		<b>5-501.18</b>	<b>Cleaning Implements and Supplies.</b>
10		<b>5-501.19</b>	<b>Storage Areas, Redeeming Machines,</b>
11			<b>Receptacles and Waste Handling Units,</b>
12			<b>Location.</b>
13		<b>5-501.110</b>	<b>Storage Refuse, Recyclables, and</b>
14			<b>Returnables.</b>
15		<b>5-501.111</b>	<b>Areas, Enclosures, and Receptacles, Good</b>
16			<b>Repair.</b>
17		<b>5-501.112</b>	<b>Outside Storage Prohibitions.</b>
18		<b>5-501.113</b>	<b>Covering Receptacles.</b>
19		<b>5-501.114</b>	<b>Using Drain Plugs.</b>
20		<b>5-501.115</b>	<b>Maintaining Refuse Areas and Enclosures.</b>
21		<b>5-501.116</b>	<b>Cleaning Receptacles.</b>

22 Proper storage and disposal of garbage and refuse are necessary to minimize  
23 the development of odors, prevent such waste from becoming an attractant  
24 and harborage or breeding place for insects and rodents, and prevent the soiling  
25 of food preparation and food service areas. Improperly handled garbage  
26 creates nuisance conditions, makes housekeeping difficult, and may be a  
27 possible source of contamination of food, equipment, and utensils.  
28 Storage areas for garbage and refuse containers must be constructed so that  
29 they can be thoroughly cleaned in order to avoid creating an attractant or

1 harborage for insects or rodents. In addition, such storage areas must be  
2 large enough to accommodate all the containers necessitated by the operation  
3 in order to prevent scattering of the garbage and refuse.

4 All containers must be maintained in good repair and cleaned as necessary  
5 in order to store garbage and refuse under sanitary conditions as well as to  
6 prevent the breeding of flies.

7 Garbage containers should be available wherever garbage is generated to  
8 aid in the proper disposal of refuse.

9 Outside receptacles must be constructed with tight-fitting lids or covers to  
10 prevent the scattering of the garbage or refuse by birds, the breeding of flies,  
11 or the entry of rodents. Proper equipment and supplies must be made  
12 available to accomplish thorough and proper cleaning of garbage storage  
13 areas and receptacles so that unsanitary conditions can be eliminated.

14 **Removal 5-502.11 Frequency.**

15 **5-502.12 Receptacles or Vehicles.**

16 Refuse, recyclables, and returnable items, such as beverage cans and  
17 bottles, usually contain a residue of the original contents. Spillage from these  
18 containers soils receptacles and storage areas and becomes an attractant for  
19 insects, rodents, and other pests. The handling of these materials entails  
20 some of the same problems and solutions as the handling of garbage and  
21 refuse. Problems are minimized when all of these materials are removed from  
22 the premises at a reasonable frequency.

23 **Facilities 5-503.11 Community or Individual Facility.**

24 **for Disposal**  
25 **and Recycling**

26 Alternative means of solid waste disposal must be conducted properly to  
27 prevent environmental consequences and the attraction of insects, rodents, and  
28 other pests.

## 30 Chapter 6 Physical Facilities

1           **Indoor Areas           6-101.11           Surface Characteristics.**

2           Floors, walls, and ceilings that are constructed of smooth and durable surface  
3           materials are more easily cleaned.

4           Floor surfaces that are graded to drain and consist of effectively treated  
5           materials will prevent contamination of foods from dust and organisms from  
6           pooled moisture.

7           The special requirements for carpeting materials and nonabsorbent materials in  
8           areas subject to moisture are intended to ensure that the cleanability of these  
9           surfaces is retained.

10          Although food served from temporary food establishments is subject to the same  
11          potential for contamination as food served in permanent establishments, the  
12          limited capabilities and short duration of operation are recognized by less stringent  
13          requirements for surface characteristics.

14          **Outdoor Areas           6-102.11           Surface Characteristics.**

15          The requirements concerning surface characteristics of outdoor areas are  
16          intended to facilitate maintenance and minimize the accumulation of dust and  
17          mud on walking and driving areas, provide durable exterior building surfaces,  
18          and prevent the attracting, harboring, or breeding of insects, rodents, and  
19          other pests where refuse, recyclables, or returnables are stored.

20          **Cleanability           6-201.11           Floors, Walls, and Ceilings.**

21                           **6-201.12           Floors, Walls, and Ceilings, Utility Lines.**

22          Floors that are of smooth, durable construction and that are nonabsorbent are  
23          more easily cleaned. Requirements and restrictions regarding floor coverings,  
24          utility lines, and floor/wall junctures are intended to ensure that regular and  
25          effective cleaning is possible and that insect and rodent harborage is minimized.

26                   **6-201.13           Floor and Wall Junctures, Coved, and Enclosed or Sealed.**

27          When cleaning is accomplished by spraying or flushing, coving and sealing of  
28          the floor/wall junctures is required to provide a surface that is conducive to  
29          water flushing.

1 Grading of the floor to drain allows liquid wastes to be quickly carried away,  
2 thereby preventing pooling which could attract pests such as insects and  
3 rodents or contribute to problems with certain pathogens such as *Listeria*  
4 *monocytogenes*.

5 **6-201.14 Floor Carpeting, Restrictions and Installation.**

6 Requirements and restrictions regarding floor carpeting are intended to ensure  
7 that regular and effective cleaning is possible and that insect harborage is  
8 minimized. The restrictions for areas not suited for carpeting materials are  
9 designed to ensure cleanability of surfaces where accumulation of moisture or  
10 waste is likely.

11 **6-201.15 Floor Covering, Mats and Duckboards.**

12 Requirements regarding mats and duckboards are intended to ensure that  
13 regular and effective cleaning is possible and that accumulation of dirt and  
14 waste is prevented.

15 **6-201.16 Wall and Ceiling Coverings and Coatings.**

16 **6-201.17 Walls and Ceilings, Attachments.**

17 **6-201.18 Walls and Ceilings, Studs, Joists, and Rafters.**

18 Walls and ceilings that are of smooth construction, nonabsorbent, and in good  
19 repair can be easily and effectively cleaned. Special requirements related to the  
20 attachment of accessories and exposure of wall and ceiling studs, joists, and  
21 rafters are intended to ensure the cleanability of these surfaces.

22 **Functionality 6-202.11 Light Bulbs, Protective Shielding.**

23 Shielding of light bulbs helps prevent breakage. Light bulbs that are shielded,  
24 coated, or otherwise shatter-resistant are necessary to protect exposed food,  
25 clean equipment, utensils and linens, and unwrapped single-service and single-  
26 use articles from glass fragments should the bulb break.

27 **6-202.12 Heating, Ventilating, Air Conditioning System Vents.**

1 Heating and air conditioning system vents that are not properly designed and  
2 located may be difficult to clean and result in the contamination of food, food  
3 preparation surfaces, equipment, or utensils by dust or other accumulated soil  
4 from the exhaust vents.

5 **6-202.13 Insect Control Devices, Design and Installation.**

6 Insect electrocution devices are considered supplemental to good sanitation  
7 practices in meeting the Code requirement for controlling the presence of flies

8  
9 and other insects in a food establishment.

10 Improper design of the device and dead insect collection tray could allow dead  
11 insect parts and injured insects to escape, rendering the device itself a  
12 source of contamination.

13 Exposed food and food-contact surfaces must be protected from  
14 contamination by insects or insect parts. Installation of the device over food  
15 preparation areas or in close proximity to exposed food and/or food-contact  
16 surfaces could allow dead insects and/or insect parts to be impelled by the  
17 electric charge, fall, or be blown from the device onto food or food-contact  
18 surfaces.

19 **6-202.14 Toilet Rooms, Enclosed.**

20 Completely enclosed toilet facilities minimize the potential for the spread of  
21 disease by the movement of flies and other insects between the toilet facility  
22 and food preparation areas.

23 **6-202.15 Outer Openings, Protected.**

24 Insects and rodents are vectors of disease-causing microorganisms which may  
25 be transmitted to humans by contamination of food and food-contact surfaces.

26 The presence of insects and rodents is minimized by protecting outer  
27 openings to the food establishment.

28 In the National Fire Protection Association's NFPA 101, Life Safety Code,  
29 2003 Edition, doors to exit enclosures such as stairs, horizontal exits, or exit

1 passageways are required to be self closing. The Life Safety Code does not  
2 require exterior doors used as exits to be self closing, but they can be.

3 The intent of subparagraph 6-202.15(A)(3) is to protect food establishments  
4 from the entry of insects and rodents by keeping doors closed when not in  
5 use. Self-closing devices allow a door to return to its closed position after use. If  
6 an exterior door is not routinely used for entry or exit because its use is restricted  
7 by the fire protection authority for emergency use only, it is not a portal for the  
8 entry of pests and does not need a self-closing device. Doors not requiring a  
9 self-closing device include exterior emergency exit doors that open into a public  
10 way from a fire and that meet the criteria in ¶ 6-202.15(C).

11 **6-202.16 Exterior Walls and Roofs, Protective Barrier.**

12 Walls and roofs provide a barrier to protect the interior and foods from the  
13 weather, windblown dirt and debris, and flying insects.

14 **6-202.17 Outdoor Food Vending Areas, Overhead Protection.**

15 The potential for contamination from airborne dust and particulates or  
16 inclement weather is present in outside areas. Overhead protection minimizes  
17 the potential for contamination of food under such conditions.

18 **6-202.18 Outdoor Servicing Areas, Overhead Protection.**

19 Pooled water, which may result if overhead protection is not provided for  
20 outdoor servicing areas, attracts wild animals and birds and creates a  
21 condition suitable for the breeding of insects.

22 **6-202.19 Outdoor Walking and Driving Surfaces, Graded to Drain.**

23 If foot traffic is allowed to occur from undrained areas, contamination will be  
24 tracked into the establishment. Surfaces graded to drain minimize these  
25 conditions. Pooled water on exterior walking and driving surfaces may also  
26 attract rodents and breed insects.

27 **6-202.110 Outdoor Refuse Areas, Curbed and Graded to Drain.**

28 If refuse areas are not graded properly, waste water will pool and attract  
29 insects and rodents.

1           **6-202.111    Private Homes and Living or Sleeping Quarters, Use Prohibited.**

2                           **6-202.112    Living or Sleeping Quarters, Separation.**

3           Areas or facilities that are not compatible with sanitary food establishment  
4           operations must be located or separated from other areas of the establishment  
5           to preclude potential contamination of food and food-contact surfaces from  
6           poisonous or toxic materials, dust or debris, the presence of improperly  
7           designed facilities and equipment, and the traffic of unauthorized and/or  
8           unnecessary persons or pets.

9           Further, Article IV of the Amendments to the U.S. Constitution ensures the  
10          right of persons to be secure in their homes against unreasonable search and  
11          seizure. This provision could hinder the regulatory authority's access to  
12          conduct routine inspections of a food establishment operated in the living area  
13          of a private home. A search warrant may be the only mechanism by which to  
14          gain entry; yet, it may be difficult to obtain and might not authorize the  
15          necessary inspectional activities.

16          ***Handwashing*       6-301.10    Minimum Number.**

17          ***Sinks***

18          Refer to the public health reason for § 5-203.11.

19                           **6-301.11    Handwashing Cleanser, Availability.**

20          Hand cleanser must always be present to aid in reducing microorganisms and  
21          particulate matter found on hands.

22                           **6-301.12    Hand Drying Provision.**

23          Provisions must be provided for hand drying so that employees will not dry their  
24          hands on their clothing or other unclean materials.

25                           **6-301.14    Handwashing Signage.**

1 A sign or poster is required to remind food employees to wash their hands.

2 **6-301.20 Disposable Towels, Waste Receptacle.**

3 Waste receptacles at handwashing sinks are required for the collection of  
4 disposable towels so that the paper waste will be contained, will not contact  
5 food directly or indirectly, and will not become an attractant for insects or  
6 rodents.

7 **Toilets and 6-302.10 Minimum Number.**  
8 **Urinals**

9 Refer to the public health reason for § 5-203.12.

10 **6-302.11 Toilet Tissue, Availability.**

11 To minimize hand contact with fecal waste, toilet tissue is necessary for  
12 hygienic cleaning following use of toilet facilities. Toilet tissue must be  
13 supplied to meet the demand.

14 **Lighting 6-303.11 Intensity.**

15 Lighting levels are specified so that sufficient light is available to enable  
16 employees to perform certain functions such as reading labels; discerning the  
17 color of substances; identifying toxic materials; recognizing the condition of  
18 food, utensils, and supplies; and safely conducting general food establishment  
19 operations and clean-up. Properly distributed light makes the need for cleaning  
20 apparent by making accumulations of soil conspicuous.

21 **Ventilation 6-304.11 Mechanical.**

22 When mechanical ventilation is necessary, it must have adequate capacity to  
23 ensure that soiling of walls, ceilings, and other equipment is minimized;  
24 obnoxious odors or toxic fumes are effectively removed; and no hazards or  
25 nuisances involving accumulation of fats, oils, and similar wastes are created.  
26 Balancing of the exhaust and make-up air must be ensured so that the system  
27 can operate efficiently.

1        ***Dressing Areas***    **6-305.11**    **Designation.**  
2        ***and Lockers***

3        Street clothing and personal belongings can contaminate food, food equipment,  
4        and food-contact surfaces. Proper storage facilities are required for articles such  
5        as purses, coats, shoes, and personal medications.

6        ***Service Sinks***        **6-306.10**    **Availability.**

7        A service sink or curbed facility is required so that the cleanliness of the food  
8        establishment can be maintained, attractants for insects and rodents minimized,  
9        and contamination of food and equipment by accumulated soil prevented.  
10       Liquid wastes generated during cleaning must be disposed of in a sanitary  
11       manner to preclude contamination of food and food equipment. A service  
12       sink is provided to prevent the improper disposal of wastes into other sinks  
13       such as food preparation and handwashing sinks.

14       ***Handwashing***        **6-401.10**    **Conveniently Located.**

15       ***Sinks***

16       Facilities must be located in or adjacent to toilet rooms and convenient to the  
17       different work stations of the food employee for proper and routine  
18       handwashing to prevent contamination of the food and food-contact surfaces.

19       ***Toilet Rooms***                **6-402.11**    **Convenience and Accessibility.**

20       Toilet rooms must be conveniently accessible to food employees at all times to  
21       encourage employee use of appropriate facilities for the disposing of human  
22       wastes as needed followed by the washing of hands.

23       ***Employee***                        **6-403.11**    **Designated Areas.**

24       ***Accommodations***

25       Because employees could introduce pathogens to food by hand-to-mouth-to-  
26       food contact and because street clothing and personal belongings carry  
27       contaminants, areas designated to accommodate employees' personal needs  
28       must be carefully located. Food, food equipment and utensils, clean linens, and  
29       single-service and single-use articles must not be in jeopardy of contamination  
30       from these areas.

1           **Distressed 6-404.11 Segregation and Location.**

2           **Merchandise**

3           Products which are damaged, spoiled, or otherwise unfit for sale or use in a  
4           food establishment may become mistaken for safe and wholesome products and/or  
5           cause contamination of other foods, equipment, utensils, linens, or single-  
6           service or single-use articles. To preclude this, separate and segregated  
7           areas must be designated for storing unsalable goods.

8           **Refuse, 6-405.10 Receptacles, Waste Handling Units, and**  
9           **Recyclables, Designated Storage Areas.**  
10          **and Returnables**

11          Waste materials and empty product containers are unclean and can be an  
12          attractant to insects and rodents. Food, equipment, utensils, linens, and single-  
13          service and single-use articles must be protected from exposure to filth and  
14          unclean conditions and other contaminants. This Code provision addresses  
15          these concerns by requiring the facility to be segregated, to be located to allow  
16          cleaning of adjacent areas, and to preclude creation of a nuisance.

17          **Premises, 6-501.11 Repairing.**  
18          **Structures,**  
19          **Attachments,**  
20          **and Fixtures,**  
21          **- Methods**

22          Poor repair and maintenance compromises the functionality of the physical  
23          facilities. This requirement is intended to ensure that the physical facilities are  
24          properly maintained in order to serve their intended purpose.

25                           **6-501.12 Cleaning, Frequency and Restrictions.**

26          Cleaning of the physical facilities is an important measure in ensuring the  
27          protection and sanitary preparation of food. A regular cleaning schedule should  
28          be established and followed to maintain the facility in a clean and sanitary  
29          manner. Primary cleaning should be done at times when foods are in protected  
30          storage and when food is not being served or prepared.

1                                   **6-501.13     Cleaning Floors, Dustless Methods.**

2                   Dustless floor cleaning methods must be used so that food; equipment,  
3                   utensils, and linens; and single-service and single-use articles are not  
4                   contaminated.

5                                   **6-501.14     Cleaning Ventilation Systems, Nuisance and Discharge**  
6                                   **Prohibition.**

7                   Both intake and exhaust ducts can be a source of contamination and must be  
8                   cleaned regularly. Filters that collect particulate matter must be cleaned or changed  
9                   frequently to prevent overloading of the filter. Outside areas under or adjacent to  
10                  exhaust duct outlets at the exterior of the building must be maintained in a clean  
11                  and sanitary manner to prevent pest attraction.

12                                  **6-501.15     Cleaning Maintenance Tools, Preventing Contamination.\***

13                  Maintenance tools used to repair the physical facilities must be cleaned in a  
14                  separate area to prevent contamination of food and food preparation and  
15                  warewashing areas.

16    **6-501.16     Drying Mops.**

17                  Mops can contaminate food and food preparation areas if not properly cleaned  
18                  and stored after use. Mops should be cleaned and dried in a sanitary manner  
19  
20                  away from food flow areas.

21    **6-501.17     Absorbent Materials on Floors, Use Limitation.**

22                  Cleanliness of the food establishment is important to minimize attractants for  
23                  insects and rodents, aid in preventing the contamination of food and  
24                  equipment  
25                  and prevent nuisance conditions. A clean and orderly food establishment is  
26                  also conducive to positive employee attitudes which can lead to increased  
27                  attention to personal hygiene and improved food preparation practices. Use of  
28                  specified cleaning procedures is important in precluding avoidable contamination  
29                  of food and equipment and nuisance conditions.

1 Temporary floor coverings such as sawdust can contaminate food, attract  
2 insects and rodents, and become a nuisance to the food operation.

3 **6-501.18 Maintaining and Using Handwashing Sinks.**

4 Handwashing facilities are critical to food protection and must be maintained  
5 in operating order at all times so they will be used.

6 Refer also to the public health reason for § 5-205.11.

7 **6-501.19 Closing Toilet Room Doors.**

8 Toilet room doors must remain closed except during cleaning operations to  
9 prevent insect and rodent entrance and the associated potential for the  
10 spread of disease.

11 **6-501.110 Using Dressing Rooms and Lockers.**

12 Street clothing and personal belongings can contaminate food, food  
13 equipment, and food preparation surfaces and consequently must be stored  
14 in properly designated areas or rooms.

15 **6-501.111 Controlling Pests.\***

16 Insects and other pests are capable of transmitting disease to man by  
17 contaminating food and food-contact surfaces. Effective measures must be taken  
18 to control their presence in food establishments.

19 **6-501.112 Removing Dead or Trapped Birds, Insects, Rodents, and Other**  
20 **Pests.**

21 Dead rodents, birds, and insects must be removed promptly from the facilities  
22 to ensure clean and sanitary facilities and to preclude exacerbating the  
23 situation by allowing carcasses to attract other pests.

24 **6-501.113 Storing Maintenance Tools.**

25 Brooms, mops, vacuum cleaners, and other maintenance equipment can  
26 contribute contamination to food and food-contact surfaces. These items must  
27 be stored in a manner that precludes such contamination.

28 To prevent harborage and breeding conditions for rodents and insects,  
29 maintenance equipment must be stored in an orderly fashion to permit  
30 cleaning of the area.

1                   **6-501.114    Maintaining Premises, Unnecessary Items and Litter.**

2                   The presence of unnecessary articles, including equipment which is no longer  
3                   used, makes regular and effective cleaning more difficult and less likely. It can  
4                   also provide harborage for insects and rodents.

5                   Areas designated as equipment storage areas and closets must be maintained  
6                   in a neat, clean, and sanitary manner. They must be routinely cleaned to avoid  
7                   attractive or harborage conditions for rodents and insects.

8                                   **6-501.115    Prohibiting Animals.\***

9                   Animals carry disease-causing organisms and can transmit pathogens to humans  
10                  through direct and/or indirect contamination of food and food-contact surfaces.

11                  The restrictions apply to live animals with limited access allowed only in  
12                  specific situations and under controlled conditions and to the storage of live and  
13                  dead fish bait. Employees with service animals are required under § 2-301.14  
14                  to wash their hands after each contact with animals to remove bacteria and  
15                  soil.

16                  Animals shed hair continuously and may deposit liquid or fecal waste,  
17                  creating the need for vigilance and more frequent and rigorous cleaning  
18                  efforts.

19                  The definition for “service animal” is adapted from 28 CFR 36.104 adopted  
20                  pursuant to the Americans with Disabilities Act (ADA) of 1990 (42 U.S.C. 12101  
21                  et seq.). A service animal performs some of the functions that persons with a  
22                  disability cannot perform for themselves, such as those provided by “seeing  
23                  eye dogs”; alerting persons with hearing impairments to sounds; pulling  
24                  wheelchairs or carrying and picking up things for persons with mobility  
25                  impairments; and assisting persons with mobility impairments with balance. A  
26                  service animal is not considered to be a pet.

27                  Under Title III of the ADA, privately owned businesses that serve the public are  
28                  prohibited from discriminating against individuals with disabilities. The ADA  
29                  requires these businesses to allow people with disabilities to bring their service  
30                  animals onto business premises in whatever areas customers are generally

1 allowed. Some, but not all, service animals wear special collars or harnesses.  
2 Some, but not all, are licensed or certified and have identification papers.  
3 Decisions regarding a food employee or applicant with a disability who needs to  
4 use a service animal should be made on a case-by-case basis. An employer  
5 must comply with health and safety requirements, but is obligated to consider  
6 whether there is a reasonable accommodation that can be made. Guidance is  
7 available from the U.S. Department of Justice, Civil Rights Division, Disability  
8 Rights Section or the U.S. Equal Employment Opportunity Commission, the  
9 Federal agency which has the lead in these matters, in documents such as,  
10 “Commonly Asked Questions About Service Animals in Places of Business”;  
11 “The Americans with Disabilities Act Questions and Answers”; “A Guide to  
12 Disability Rights Laws”; and “Americans with Disabilities Act Title III Technical  
13 Assistance Manual, 1994 Supplement.” The ADA Information Line is 800-514-  
14 0301 (voice) or 800-514-0383 (TDD) and the Internet Home Page address is  
15 <http://www.usdoj.gov/crt/ada/adahom1.htm>.

## 17 Chapter 7 Poisonous or Toxic Materials

18 ***Original* 7-101.11 Identifying Information, Prominence.\***

### 19 ***Containers***

20 The accidental contamination of food or food-contact surfaces can cause  
21 serious illness. Prominent and distinct labeling helps ensure that poisonous  
22 and toxic materials including personal care items are properly used.

23 ***Working* 7-102.11 Common Name.\***

### 24 ***Containers***

25 It is common practice in food establishments to purchase many poisonous or  
26 toxic materials including cleaners and sanitizers in bulk containers. Working  
27 containers are frequently used to convey these materials to areas where they  
28 will be used, resulting in working containers being stored in different locations  
29 in the establishment. Identification of these containers with the common name  
30 of the material helps prevent the dangerous misuse of the contents.

1 surfaces. Residues of certain materials are not discernible to the naked eye and  
2 present an additional risk to the employee and consumer.

3 Because of the toxicity of restricted use pesticides, they can only be applied by  
4 certified operators. A certified operator would be aware of the dangers involved  
5 in the contamination of food and food-contact surfaces during the application of  
6 these materials. Improperly applied pesticides present health risks to employees  
7 as well as consumers and special precautions must be taken when restricted  
8 use pesticides are applied.

9 **Container 7-203.11 Poisonous or Toxic Material Containers.\***

10 **Prohibitions**

11 Use of poisonous or toxic material containers to store, transport, or dispense  
12 food is prohibited because of the potential for contamination of the food. The  
13 risk of serious medical consequences to anyone consuming food stored in these  
14 containers coupled with the lack of confidence that all of the material could or  
15 would be removed in the wash and sanitizing procedures are reasons for  
16 prohibiting this practice.

17 **Chemicals 7-204.11 Sanitizers, Criteria.\***

18 See explanation in § 4-501.114.

19 Chemical sanitizers are included with poisonous or toxic materials because  
20 they may be toxic if not used in accordance with requirements listed in the  
21 Code of Federal Regulations (CFR). Large concentrations of sanitizer in  
22 excess of the CFR requirements can be harmful because residues of the  
23 materials remain. The CFR reference that is provided lists concentrations of  
24 sanitizers that are considered safe.

25 **7-204.12 Chemicals for Washing Fruits and Vegetables,**  
26 **Criteria.\***

27 **7-204.13 Boiler Water Additives, Criteria.\***

28 **7-204.14 Drying Agents, Criteria.\***

29 If the chemical wash, boiler water additive, or drying agent used is not made  
30 up of components that are approved as food additives or generally

1 recognized as safe, illness may result. This could be due to residues that may  
2 remain from the use of compounds such as unrecognized drying agents. This  
3 is why only those chemicals that are listed in the CFR can be used.

4 Chemicals that are not listed for these uses may be submitted for review by  
5 filing a Food Additive Petition. Wash chemicals, boiler water additives, and  
6 drying agents are classified as food additives because of the possibility that  
7 they may end up in food. Therefore, they are subject to review before being  
8 used or listed in the CFR.

9 21 CFR Section 173.315 specifically identifies chemicals that may be used in  
10 washing fruits and vegetables, but it **does not specify any maximum level**  
11 (2000 ppm or otherwise) of chemical usage for sodium hypochlorite. FDA  
12 acknowledges the use of sodium hypochlorite on fruits and vegetables and  
13 also allows calcium hypochlorite to be used interchangeably with sodium  
14 hypochlorite under 21 CFR 173.315.

15 Boiler water additives that may be safely used in the preparation of steam that  
16 may contact food, and their condition of use, are identified in 21 CFR 173.310  
17 Boiler Water Additives.

18 **Lubricants 7-205.11 Incidental Food Contact, Criteria.\***

19 Lubricants used on food equipment may directly or indirectly end up in the food.  
20 Therefore, the lubricants used must be approved as food additives or generally  
21 recognized as safe and listed in the CFR. Lubricants that are not safe present  
22 the possibility of foodborne illness if they find their way into the food.

23 **Pesticides 7-206.11 Restricted Use Pesticides, Criteria.\***

24 **7-206.12 Rodent Bait Stations.\***

25 Open bait stations may result in the spillage of the poison being used.  
26 Also, it is easier for pests to transport the potentially toxic bait throughout the  
27 establishment. Consequently, the bait may end up on food-contact surfaces and  
28 ultimately in the food being prepared or served.

29 **7-206.13 Tracking Powders, Pest Control and Monitoring.\***

1 The use of tracking powder pesticides presents the potential for the powder to  
2 be dispersed throughout the establishment. Consequently, the powder could  
3 directly or indirectly contaminate food being prepared. This contamination  
4 could adversely affect both the safety and quality of the food and, therefore,  
5 tracking powder pesticides are not allowed.

6 **Medicines 7-207.11 Restriction and Storage.\***

7 Medicines that are not necessary for the health of employees present an  
8 unjustified risk to the health of other employees and consumers due to misuse  
9 and/or improper storage.

10 There are circumstances that require employees or children in a day care center  
11 to have personal medications on hand in the establishment. To prevent  
12 misuse, personal medications must be labeled and stored in accordance with  
13 the requirements stated for poisonous or toxic materials. Proper labeling and  
14 storage of medicines to ensure that they are not accidentally misused or  
15 otherwise contaminate food or food-contact surfaces.

16 **7-207.12 Refrigerated Medicines, Storage.\***

17 Some employee medications may require refrigerated storage. If employee  
18 medications are stored in a food refrigerator, precautions must be taken  
19 to prevent the contamination of other items stored in the same refrigerator.

20 **First Aid 7-208.11 Storage.\***

21 **Supplies**

22 First aid supplies for employee use must be identified and stored in accordance  
23 with the requirements of this Code in order to preclude the accidental  
24 contamination of food, food equipment, and other food-contact surfaces.

25 **Other Personal 7-209.11 Storage.**

26 **Care Items**

27 Employee personal care items may serve as a source of contamination and  
28 May contaminate food, food equipment, and food-contact surfaces if they are  
29 not properly labeled and stored.

30 **Storage and 7-301.11 Separation.\***

1 regulatory authority during inspections. Operating procedures should include  
2 definitive practices and expectations that ensure that:

- 3 (1) The transmission of foodborne disease is prevented by  
4 managing job applicants and food employees as specified under  
5 Subpart 2-201,
- 6 (2) Food is received from approved sources as specified under  
7 § 3-201.11,
- 8 (3) Food is managed so that the safety and integrity of the food from  
9 the time of delivery to the establishment throughout its storage,  
10 preparation, and transportation to the point of sale or service to the  
11 consumer is protected,
- 12 (4) Potentially hazardous (time/temperature control for safety) food is  
13 maintained, including freezing, cold holding, cooking, hot holding,  
14 cooling, reheating, and serving in conformance with the  
15 temperature and time requirements specified under Parts 3-4 and  
16 3-5,
- 17 (5) Warewashing is effective, including assurance that the chemical  
18 solutions and exposure times necessary for cleaning and sanitizing  
19 utensils and food-contact surfaces of equipment are provided as  
20 specified under Parts 4-6 and 4-7, and
- 21 (6) Records that are specified under §§ 3-203.11, 3-203.12, and  
22 5-205.13 are retained for inspection.

23 During the plan review stage, the regulatory authority and a management  
24 representative of the proposed food establishment should discuss available  
25 training options that may be used to train food employees and the person in  
26 charge regarding food safety as it relates to their assigned duties. By the time of  
27 the preoperational inspection, operating procedures for training should include  
28 definitive practices and expectations of how the management of the proposed  
29 food establishment plans to comply with § 2-103.11(L) of this Code which

1 requires the person in charge to assure that food employees are properly trained  
2 in food safety as it relates to their assigned duties.

3 **8-402.10 Competency of Inspectors.**

4 Regulatory agencies are encouraged to use Standard #2 of the draft *FDA's*  
5 *Recommended National Retail Food Regulatory Program Standards*  
6 (<http://www.cfsan.fda.gov/~dms/ret-toc.html>) to ensure employees who inspect  
7 food establishments are properly trained. Regulatory inspectors are also  
8 encouraged to seek food safety certification through a nationally recognized  
9 and accredited program.

2 **2 Management of Food Safety**  
3 **Practices – Achieving Active**  
4 **Managerial Control of Foodborne**  
5 **Illness Risk Factors**

- 6 1. **ACTIVE MANAGERIAL CONTROL**  
7 2. **INTRODUCTION TO HACCP**  
8 3. **THE HACCP PRINCIPLES**  
9 4. **THE PROCESS APPROACH – A PRACTICAL APPLICATION OF HACCP AT**  
10 **RETAIL TO ACHIEVE ACTIVE MANAGERIAL CONTROL**  
11 5. **FDA RETAIL HACCP MANUALS**  
12 6. **ADVANTAGES OF THE HACCP PRINCIPLES**  
13 7. **SUMMARY**  
14 8. **ACKNOWLEDGEMENTS**  
15 9. **RESOURCES AND REFERENCES**

16  
17 1. **ACTIVE MANAGERIAL CONTROL**

18 **(A) What is the common goal of operators and regulators of retail food**  
19 **and food service establishments and what is presently being done to**  
20 **achieve this goal?**

21 The common goal of operators and regulators of retail and food service  
22 establishments is to produce safe, quality food for consumers. Since the onset  
23 of regulatory oversight of retail and food service operations, regulatory inspections  
24 have emphasized the recognition and correction of food safety violations that exist  
25 at the time of the inspection. Recurring violations have traditionally been handled  
26 through re-inspections or enforcement activities such as fines, suspension of  
27 permits, or closures. Operators of retail and food service establishments routinely

1 respond to inspection findings by correcting violations, but often do not implement  
2 proactive systems of control to prevent violations from recurring. While this type of  
3 inspection and enforcement system has done a great deal to improve basic sanitation  
4 and to upgrade facilities in the United States, it emphasizes reactive rather than  
5 preventive measures to food safety. Additional measures must be taken on the part of  
6 operators and regulators to better prevent or reduce foodborne illness. Annex 3 of  
7 the Guam Food Code provides additional information on conducting risk-based  
8 inspections. It should be reviewed in conjunction with the material found in this  
9 Annex to better understand the role of the regulator in facilitating active  
10 managerial control by the operator.

11 **(B) Who has the ultimate responsibility for providing safe food to the consumer?**

12 The responsibility of providing safe food to the consumer is shared by many people in  
13 every stage in the production of food, including consumers, themselves. Since most  
14 consumers receive their food from retail and food service establishments, a  
15 significant share of the responsibility for providing safe food to the consumer rests  
16 with these facilities. Working together with their regulatory authorities, operators of  
17 retail and food service establishments can make the greatest impact on food safety.

18 **(C) How can foodborne illness be reduced?**

19 The Centers for Disease Control and Prevention (CDC) Surveillance Report for  
20 1993-1997, "Surveillance for Foodborne - Disease Outbreaks – United States,"  
21 identifies the most significant contributing factors to foodborne illness. Five of these  
22 broad categories of contributing factors directly relate to food safety concerns within  
23 retail and food service establishments and are collectively termed by the FDA as  
24 "foodborne illness risk factors." These five broad categories are:

- 25 • Food from Unsafe Sources
- 26 • Inadequate Cooking
- 27 • Improper Holding Temperatures
- 28 • Contaminated Equipment
- 29 • Poor Personal Hygiene.

30 In 1998, FDA initiated a project designed to determine the incidence of foodborne

1 illness risk factors in retail and food service establishments. Inspections focusing on  
2 the occurrence of foodborne illness risk factors were conducted in establishments  
3 throughout the United States. The results of this project are published in the 2000  
4 *Report of the FDA Retail Food Program Database of Foodborne Illness Risk*  
5 *Factors*, commonly referred to as the “FDA Baseline Report.” The Baseline Report  
6 is available from FDA through the following website:  
7 <http://www.cfsan.fda.gov/~dms/retrsk.html>. The data collection project was repeated in  
8 2003 and the results are published in the *FDA Report on the Occurrence of Foodborne*  
9 *Illness Risk Factors in Selected Institutional Foodservice, Restaurant, and Retail Food*  
10 *Store Facility Types (2004)*. This second report is available from FDA through the  
11 following website: <http://www.cfsan.fda.gov/~dms/retrsk2.html> . An additional data  
12 collection project is planned for 2008.

13 The CDC Surveillance Report and the results from the FDA Baseline Report and  
14 second data collection project, support the concept that operators of retail and food  
15 service establishments must be proactive and implement food safety management  
16 systems that will prevent, eliminate, or reduce the occurrence of foodborne illness  
17 risk factors. By reducing the occurrence of foodborne illness risk factors, foodborne  
18 illness can also be reduced.

19 **(D) How can the occurrence of foodborne illness risk factors be reduced?**

20 To effectively reduce the occurrence of foodborne illness risk factors, operators of  
21 retail and food service establishments must focus their efforts on achieving active  
22 managerial control. The term “active managerial control” is used to describe  
23 industry’s responsibility for developing and implementing food safety management  
24 systems to prevent, eliminate, or reduce the occurrence of foodborne illness risk  
25 factors.

26 Active managerial control means the purposeful incorporation of specific actions or  
27 procedures by industry management into the operation of their business to attain  
28 control over foodborne illness risk factors. It embodies a preventive rather than  
29 reactive approach to food safety through a continuous system of monitoring and  
30 verification.

31 There are many tools that can be used by industry to provide active managerial

1 control of foodborne illness risk factors. Regulatory inspections and follow-up activities  
2 must also be proactive by using an inspection process designed to assess the  
3 degree of active managerial control that retail and food service operators have over  
4 the foodborne illness risk factors. In addition, regulators must assist operators  
5 in developing and implementing voluntary strategies to strengthen existing  
6 industry systems to prevent the occurrence of foodborne illness risk factors.  
7 Elements of an effective food safety management system may include the  
8 following:

- 9 • Certified food protection managers who have shown a proficiency in  
10 required information by passing a test that is part of an accredited  
11 program
- 12 • Standard operating procedures (SOPs) for performing critical  
13 operational steps in a food preparation process, such as cooling
- 14 • Recipe cards that contain the specific steps for preparing a food item  
15 and the food safety critical limits, such as final cooking temperatures,  
16 that need to be monitored and verified
- 17 • Purchase specifications
- 18 • Equipment and facility design and maintenance
- 19 • Monitoring procedures
- 20 • Record keeping
- 21 • Employee health policy for restricting or excluding ill employees
- 22 • Manager and employee training
- 23 • On-going quality control and assurance
- 24 • Specific goal-oriented plans, like Risk Control Plans (RCPs), that outline  
25 procedures for controlling foodborne illness risk factors.

26 A food safety management system based on Hazard Analysis and Critical Control  
27 Point (HACCP) principles contains many of these elements and provides a  
28 comprehensive framework by which an operator can effectively control the  
29 occurrence of foodborne illness risk factors.

1           **2.     INTRODUCTION TO HACCP**

2           **(A)    What is HACCP and how can it be used by operators and regulators of retail**  
3           **food and food service establishments?**

4           Hazard Analysis and Critical Control Point (HACCP) is a systematic approach to  
5           identifying, evaluating, and controlling food safety hazards. Food safety hazards are  
6           biological, chemical, or physical agents that are reasonably likely to cause illness or  
7           injury in the absence of their control. Because a HACCP program is designed to  
8           ensure that hazards are prevented, eliminated, or reduced to an acceptable level  
9           before a food reaches the consumer, it embodies the preventive nature of “active  
10          managerial control.”

11          Active managerial control through the use of HACCP principles is achieved by  
12          identifying the food safety hazards attributed to products, determining the necessary  
13          steps that will control the identified hazards, and implementing on-going practices or  
14          procedures that will ensure safe food.

15          Like many other quality assurance programs, HACCP provides a common-sense  
16          approach to identifying and controlling problems that are likely to exist in an  
17          operation. Consequently, many food safety management systems at the retail level  
18          already incorporate some, if not all, of the principles of HACCP. Combined with  
19          good basic sanitation, a solid employee training program, and other prerequisite  
20          programs, a food safety management system based on HACCP principles will  
21          prevent, eliminate, or reduce the occurrence of foodborne illness risk factors that  
22          lead to out-of-control hazards.

23          HACCP represents an important tool in food protection that small independent  
24          businesses as well as national companies can use to achieve active managerial  
25          control of risk factors. The *Food Code* requires a comprehensive HACCP plan  
26          when conducting certain specialized processes at retail such as when a variance  
27          is granted or when a reduced oxygen packaging method is used. However, in  
28          general, the implementation of HACCP at the retail level is voluntary. FDA  
29          endorses the voluntary implementation of food safety management systems based on  
30          HACCP principles as an effective means for controlling the occurrence of foodborne  
31          illness risk factors that result in out-of-control hazards.

1 While the operator is responsible for developing and implementing a system of  
2 controls to prevent foodborne illness risk factors, the role of the regulator is to  
3 assess whether the system the operator has in place is achieving control of  
4 foodborne illness risk factors. Using HACCP principles during inspections will  
5 enhance the effectiveness of routine inspections by incorporating a risk-based  
6 approach. This helps inspectors focus their inspection on evaluating the  
7 effectiveness of food safety management systems implemented by industry to control  
8 foodborne illness risk factors.

9 The principles of HACCP are also an integral part of the draft *FDA's*  
10 *Recommended Voluntary National Retail Food Regulatory Program Standards*. For  
11 regulatory program managers, the use of risk-based inspection methodology based  
12 on HACCP principles is a viable and practical option for evaluating the degree of  
13 active managerial control operators have over the foodborne illness risk factors. The  
14 complete set of *Program Standards* is available from FDA through the following  
15 website: <http://www.cfsan.fda.gov/~dms/ret-toc.html>.

16 **(B) What are the Seven HACCP Principles?**

17 In November 1992, the National Advisory Committee on Microbiological Criteria for  
18 Foods (NACMCF) defined seven widely accepted HACCP principles that explained the  
19 HACCP process in great detail. In 1997, NACMCF reconvened to review the 1992  
20 document and compare it to current HACCP guidance prepared by the CODEX  
21 Committee on Food Hygiene. Based on this review, NACMCF again endorsed  
22 HACCP and defined HACCP as a systematic approach to the identification,  
23 evaluation, and control of food safety. Based on a solid foundation of prerequisite  
24 programs to control basic operational and sanitation conditions, the following  
25 seven basic principles are used to accomplish this objective:

26 Principle 1: Conduct a hazard analysis

27 Principle 2: Determine the critical control points (CCPs)

28 Principle 3: Establish critical limits

29 Principle 4: Establish monitoring procedures

30 Principle 5: Establish corrective actions

31 Principle 6: Establish verification procedures

1 Principle 7: Establish record-keeping and documentation procedures.

2 This Annex will provide a brief overview of each of the seven principles of  
3 HACCP. A more comprehensive discussion of these principles is available from  
4 FDA by accessing the NACMCF guidance document on the FDA website at:  
5 <http://www.cfsan.fda.gov/~comm/nacmcfp.html>. Following the overview, a practical  
6 scheme for applying and implementing the HACCP principles in retail and food  
7 service establishments is presented.

### 8 **(C) What are Prerequisite Programs?**

9 In order for a HACCP system to be effective, a strong foundation of procedures that  
10 address the basic operational and sanitation conditions within an operation must first  
11 be developed and implemented. These procedures are collectively termed “prerequisite  
12 programs.” When prerequisite programs are in place, more attention can be given to  
13 controlling hazards associated with the food and its preparation. Prerequisite programs  
14 may include such things as:

- 15 • Vendor certification programs
- 16 • Training programs
- 17 • Allergen management
- 18 • Buyer specifications
- 19 • Recipe/process instructions
- 20 • First-In-First-Out (FIFO) procedures
- 21 • Other Standard Operating Procedures (SOPs).

22 Basic prerequisite programs should be in place to:

- 23 • Protect products from contamination by biological, chemical, and physical  
24 food safety hazards
- 25 • Control bacterial growth that can result from temperature abuse
- 26 • Maintain equipment.

27 Additional information about prerequisite programs and the types of activities  
28 usually included in them can be found in the FDA’s Retail HACCP manuals  
29 discussed later in this Annex or by accessing the NACMCF guidance document on  
30 the FDA website.

1           **3. THE HACCP PRINCIPLES**

2           **(A) Principle #1: Conduct a Hazard Analysis**

3           **(1) What is a food safety hazard?**

4           A hazard is a biological, chemical, or physical property that may cause a food to  
5           be unsafe for human consumption.

6           **(2) What are biological hazards?**

7           Biological hazards include bacterial, viral, and parasitic microorganisms. See Table  
8           1 in this Annex for a listing of selected biological hazards. Bacterial pathogens  
9           comprise the majority of confirmed foodborne disease outbreaks and cases.  
10          Although cooking destroys the vegetative cells of foodborne bacteria to acceptable  
11          levels, spores of spore-forming bacteria such as *Bacillus cereus*, *Clostridium*  
12          *botulinum*, and *Clostridium perfringens* survive cooking and may germinate and  
13          grow if food is not properly cooled or held after cooking. The toxins produced by  
14          the vegetative cells of *Bacillus cereus*, *Clostridium botulinum*, and *Staphylococcus*  
15          *aureus* may not be destroyed to safe levels by reheating. Post-cook  
16          recontamination with vegetative cells of bacteria such as *Salmonellae* and  
17          *Campylobacter jejuni* is also a major concern for operators of retail and food  
18          service establishments.

19          Viruses such as norovirus, hepatitis A, and rotavirus are directly related to  
20          contamination from human feces. Recent outbreaks have also shown that these  
21          viruses may be transmitted via droplets in the air. In limited cases, foodborne  
22          viruses may occur in raw commodities contaminated by human feces (e.g.,  
23          shellfish harvested from unapproved, polluted waters). In most cases, however,  
24          contamination of food by viruses is the result of cross-contamination by ill food  
25          employees or unclean equipment and utensils. Unlike bacteria, a virus cannot  
26          multiply outside of a living cell. Cooking as a control for viruses may be  
27          ineffective because many foodborne viruses seem to exhibit heat resistance  
28          exceeding cooking temperature requirements, under laboratory conditions.  
29          Obtaining food from approved sources, practicing no bare hand contact with  
30          ready-to-eat food as well as proper handwashing, and implementing an employee

1 health policy to restrict or exclude ill employees are important control measures for  
2 viruses.

3 Parasites are most often animal host-specific, but can include humans in their life  
4 cycles. Parasitic infections are commonly associated with undercooking meat  
5 products or cross-contamination of ready-to-eat food with raw animal foods,  
6 untreated water, or contaminated equipment or utensils. Like viruses, parasites  
7 do not grow in food, so control is focused on destroying the parasites and/or  
8 preventing their introduction. Adequate cooking destroys parasites. In addition,  
9 parasites in fish to be consumed raw or undercooked can also be destroyed by  
10 effective freezing techniques. Parasitic contamination by ill employees can be  
11 prevented by proper handwashing, no bare hand contact with ready-to-eat food,  
12 and implementation of an employee health policy to restrict or exclude ill  
13 employees. **Annex 2, Table 1. Selected Biological Hazards Found at Retail, Associated Foods,  
14 and Control Measures**

15

1	<b><u>HAZARD</u></b>	<b><u>ASSOCIATED FOODS</u></b>	<b><u>CONTROL MEASURES</u></b>
2	<i>Bacteria</i>		
3	<i>Bacillus cereus</i>	Meat, poultry, starchy foods (rice, potatoes),	Cooking, cooling, cold holding, hot holding
4	(intoxication caused by heat stable,	puddings, soups, cooked vegetables	
5	preformed emetic toxin		
6	and infection by heat labile, diarrheal		
7	toxin)		
8	<i>Campylobacter jejuni</i>	Poultry, raw milk	Cooking, handwashing, prevention of cross-
9	contamination		
10	<i>Clostridium botulinum</i>	Vacuum-packed foods, reduced oxygen	Thermal processing (time + pressure),
11		packaged foods, under-processed canned	cooling, cold holding, hot holding, acidification
12		foods, garlic-in-oil mixtures, time/temperature	and drying, etc.
13		abused baked potatoes/sautéed onions	
14	<i>Clostridium perfringens</i>	Cooked meat and poultry, Cooked meat and	Cooling, cold holding, reheating, hot holding
15		poultry products including casseroles, gravies	
16	<i>E. coli</i> O157:H7 (other shiga toxin-	Raw ground beef, raw seed sprouts, raw milk,	Cooking, no bare hand contact with RTE
17	producing <i>E. coli</i> )	unpasteurized juice, foods contaminated by	foods, employee health policy, handwashing,
18		infected food workers via fecal-oral route	prevention of cross-contamination,
19		pasteurization or treatment of juice	
20	<i>Listeria monocytogenes</i>	Raw meat and poultry, fresh soft cheese,	Cooking, date marking, cold holding,
21		paté, smoked seafood, deli meats, deli	handwashing, prevention of cross-
22		salads	contamination
23	<i>Salmonella spp.</i>	Meat and poultry, seafood, eggs, raw seed	Cooking, use of pasteurized eggs, employee
24		sprouts, raw vegetables, raw milk,	health policy, no bare hand contact with RTE
25		unpasteurized juice	foods, handwashing, pasteurization or
26			treatment of juice
27	<i>Shigella spp.</i>	Raw vegetables and herbs, other foods	Cooking, no bare hand contact with RTE
28		contaminated by infected workers via fecal-	foods, employee health policy, handwashing
29		oral route	
30	<i>Staphylococcus aureus</i>	RTE PHF foods touched by bare hands after	Cooling, cold holding, hot holding, no bare
31	(preformed heat stable toxin)	cooking and further time/temperature abused	hand contact with RTE food, handwashing
32	<i>Vibrio spp.</i>	Seafood, shellfish	Cooking, approved source, prevention of
33			cross-contamination, cold holding
34	<i>Parasites</i>		
35	<i>Anisakis simplex</i>	Various fish (cod, haddock, fluke, pacific	Cooking, freezing
36		salmon, herring, flounder, monkfish)	
37	<i>Taenia spp.</i>	Beef and pork	Cooking
38	<i>Trichinella spiralis</i>	Pork, bear, and seal meat	Cooking
39	<i>Viruses</i>		

1	Hepatitis A and E	Shellfish, any food contaminated by infected worker via fecal-oral route	Approved source, no bare hand contact with RTE food, minimizing bare hand contact with foods not RTE, employee health policy, handwashing
5	Other Viruses (Rotavirus, Norovirus, Reovirus)	Any food contaminated by infected worker via fecal-oral route	No bare hand contact with RTE food, minimizing bare hand contact with foods not RTE, employee health policy, handwashing

11 RTE = ready-to-eat  
 12 PHF = potentially hazardous food (time/temperature control for safety food)

15 **(3) What are Chemical Hazards?**

16 Chemical hazards may be naturally occurring or may be added during the  
 17 processing of food. High levels of toxic chemicals may cause acute cases of  
 18 foodborne illness, while chronic illness may result from low levels.

19 The Code of Federal Regulations (<http://www.access.gpo.gov/nara/cfr/cfr-table-search.html>), Title 21 Food and Drugs, provides guidance on naturally occurring  
 20 poisonous or deleterious substances, e.g., 21 CFR Parts 109 Unavoidable  
 21 Contaminants in Food for Human Consumption and Food Packaging Material, and  
 22 184 Direct Food Substances Affirmed as Generally Recognized as Safe. The  
 23 CFR also provide allowable limits for many of the chemicals added during  
 24 processing, e.g., 21 CFR Part 172 Food Additives Permitted for Direct Addition to  
 25 Food For Human Consumption.  
 26

27 FDA’s Compliance Policy Guidelines also provide information on naturally occurring  
 28 chemicals ([http://www.fda.gov/ora/compliance\\_ref/cpg/default.htm](http://www.fda.gov/ora/compliance_ref/cpg/default.htm)). See Chapter 5 –  
 29 Foods, Colors and Cosmetics. Examples include sections:

- 30 • 540.600 Fish, Shellfish, Crustaceans, and Other Aquatic Animals – Fresh,
- 31 • Frozen or Processed – Methyl Mercury,
- 32 • 555.400 Foods – Adulteration with Aflatoxin, and

- 570.200 Aflatoxin in Brazil Nuts, .375 Peanuts and Peanut Products, and 500 Pistachio Nuts.

Table 2 of this Annex provides additional examples of chemical hazards, both naturally occurring and added.

#### **(4) Food Allergens As Food Safety Hazards**

Recent studies indicate that over 11 million Americans suffer from one or more food allergies. A food allergy is caused by a naturally-occurring protein in a food or a food ingredient, which is referred to as an “allergen.” For unknown reasons, certain individuals produce immunoglobulin E (IgE) antibodies specifically directed to food allergens. When these sensitive individuals ingest sufficient concentrations of foods containing these allergens, the allergenic proteins interact with IgE antibodies and elicit an abnormal immune response. A food allergic response is commonly characterized by hives or other itchy rashes, nausea, abdominal pain, vomiting and/or diarrhea, wheezing, shortness of breath, and swelling of various parts of the body. In severe cases, anaphylactic shock and death may result. Many foods, with or without identifiable allergens, have been reported to cause food allergies. However, FDA believes there is scientific consensus that the following foods can cause a serious allergic reaction in sensitive individuals; these foods account for 90% or more of all food allergies:

- Milk
- Egg
- Fish (such as bass, flounder, or cod)
- Crustacean shellfish (such as crab, lobster, or shrimp)
- Tree nuts (such as almonds, pecans, or walnuts)
- Wheat
- Peanuts
- Soybeans.

1 Consumers with food allergies rely heavily on information contained on food labels  
2 to avoid food allergens. Each year, FDA receives reports from consumers who  
3 have experienced an adverse reaction following exposure to a food allergen.  
4 Frequently, these reactions occur either because product labeling does not inform  
5 the consumer of the presence of the allergenic ingredient in the food or because  
6 of the cross-contact of a food with an allergenic substance not intended as an  
7 ingredient of the food during processing and preparation.

8 In August 2004, the Food Allergen Labeling and Consumer Protection Act (Public  
9 Law 108-282, Title II) was enacted, which defines the term “major food allergen.”  
10 The definition of “major food allergen” adopted for use in the Food Code (see  
11 paragraph 1-201.10(B)) is consistent with the definition in the new law. The  
12 following requirements are included in the new law:

- 13 • For foods labeled on or after January 1, 2006, food manufacturers must  
14 identify in plain language on the label of the food any major food  
15 allergen used as an ingredient in the food, including a coloring,  
16 flavoring, or incidental additive.
- 17 • FDA is to conduct inspections to ensure that food facilities comply with  
18 practices to reduce or eliminate cross-contact of a food with any major  
19 food allergens that are not intentional ingredients of the food.
- 20 • Within 18 months of the date of enactment of the new law (i.e., by  
21 February 2, 2006), FDA must submit a report to Congress that  
22 analyzes the results of its food inspection findings and addresses a  
23 number of specific issues related to the production, labeling, and  
24 recall of foods that contain an undeclared major food allergen.
- 25 • Within 2 years of the date of enactment of the new law (i.e., by  
26 August 2, 2006), FDA must issue a proposed rule, and within 4  
27 years of the date of enactment of the new law (i.e., by August 2,  
28 2008), FDA must issue a final rule to define and permit the use  
29 of the term “gluten-free” on food labeling.

- FDA is to work in cooperation with the Conference for Food Protection (CFP) to pursue revision of the Food Code to provide guidelines for preparing allergen-free foods in food establishments.

**Annex 2, Table 2. Common Chemical Hazards at Retail, Along with Their Associated Foods and Control Measures**

<u>Chemical Hazards</u>	<u>Associated Foods</u>	<u>Control measures</u>
<b><u>Naturally Occurring:</u></b>		
Scombrototoxin	Primarily associated with tuna fish, mahi-mahi, blue fish, anchovies bonito, mackerel; Also found in cheese	Check temperatures at receiving; store at proper cold holding temperatures; buyer specifications: obtain verification from supplier that product has not been temperature abused prior to arrival in facility.

1	Ciguatoxin	Reef fin fish from extreme SE	Ensure fin fish have not
2		US, Hawaii, and tropical areas;	been caught:
3		barracuda, jacks, king	• Purchase fish from approved
4		mackerel, large groupers, and	sources.
5		snappers	• Fish should not be harvested
6			from an area that is subject to
7			an adverse advisory.
8	Tetrodotoxin	Puffer fish (Fugu; Blowfish)	Do not consume these fish.
9	Mycotoxins		
10		Aflatoxin	Corn and corn products, Check condition at
11	receiving; do not		
12		peanuts and peanut products,	use moldy or decomposed food.
13		cottonseed, milk, and tree nuts	
14		such as Brazil nuts, pecans,	
15		pistachio nuts, and walnuts.	
16		Other grains and nuts are	
17		susceptible but less prone to	
18		contamination.	
19			
20	Patulin	Apple juice products	Buyer Specification: obtain
21			verification from supplier or avoid
22			the use of rotten apples in
23			in juice manufacturing.
24	Toxic mushroom species	Numerous varieties of wild	Do not eat unknown varieties or
25		mushrooms	mushrooms from unapproved
26			source.
27	Shellfish toxins	Molluscan shellfish from NE	Ensure molluscan shellfish are:
28	Paralytic shellfish	and NW coastal regions;	
29	poisoning (PSP)	mackerel, viscera of lobsters	• from an approved source; and.
30		and Dungeness, tanner, and	• properly tagged and labeled.
31		red rock crabs	
32			
33	Diarrhetic shellfish	Molluscan shellfish in Japan,	
34	poisoning (DSP)	western Europe, Chile, NZ,	
35		eastern Canada	
36			
37	Neurotoxin shellfish	Molluscan shellfish from Gulf of	

1 poisoning (NSP) Mexico

2

3 Amnesic shellfish Molluscan shellfish from NE

4 poisoning (ASP) and NW coasts of NA; viscera

5 of Dungeness, tanner, red rock

6 crabs and anchovies.

7 **Annex 2, Table 2. Common Chemical Hazards at Retail, Along with Their**

8 **Associated Foods and Control Measures**

9

10 **Chemical Hazards                      Associated Foods                      Control measures**

11 **Naturally Occurring:**

12 Pyrolizidine alkaloids	13 Plants food containing these 14 alkaloids. Most commonly 15 found in members of the 16 Borginaceae, Compositae, and Leguminosae families.	17 Do not consume of food or 18 medicinals contaminated with these 19 alkaloids.
---------------------------	--	--

17 Phtyohaemmagglutinin	18 Raw red kidney beans 19 (Undercooked beans may be 20 more toxic than raw beans)	21 Soak in water for at least 5 hours. 22 Pour away the water. 23 Boil briskly in fresh water, with 24 occasional stirring, for at least 10 25 minutes.
-------------------------	--	---

22 **Added Chemicals:**

23 Environmental contaminants: 24 Pesticides, fungicides, 25 fertilizers, insecticides, 26 antibiotics, growth hormones	27 Any food may become 28 contaminated.	29 Follow label instructions for use of 30 environmental chemicals. Soil or 31 water analysis may be used to verify 32 safety.
--	--	---

27 PCBs	28 Fish	29 Comply with fish advisories.
---------	---------	---------------------------------

28 Prohibited substances 29 (21 CFR 189)	30 Numerous substances are 31 prohibited from use in human 32 food; no substance may be 33 used in human food unless it meets all applicable requirements of the FD&C Act.	34 Do not use chemical substances 35 are not approved for use in human food.
---	---	--

34 Toxic elements/compounds 35 Mercury	36 Fish exposed to organic 37 mercury: shark, tilefish, king	38 Pregnant women/women of 39 childbearing age/nursing mothers,
---	---	--

1		mackerel and swordfish	and young children should not eat
2		Grains treated with mercury	shark, swordfish, king mackerel or
3		based fungicides	tilefish because they contain high
4			levels of mercury
5			
6			Do not use mercury containing
7			fungicides on grains or animals.
8	Copper	High acid foods and beverages	Do not store high acid foods in
9			copper utensils; use backflow
10			prevention device on beverage
11			vending machines.
12	Lead	High acid foods and beverages	Do not use vessels containing lead.
13	Preservatives and Food	Fresh fruits and Vegetables	Sulfiting agents added to a product
14	Additives:	Shrimp	in a processing plant must be
15	Sulfiting agents (sulfur	Lobster	declared on labeling.
16	dioxide, sodium and	Wine	
17	potassium bisulfite,		Do not use on raw produce in food
18	sodium and potassium		establishments.
19	metabisulfite)		
20			
21			
22			
23			

**Annex 2, Table 2. Common Chemical Hazards at Retail, Along with Their Associated Foods and Control Measures**

<u>Chemical Hazards</u>	<u>Associated Foods</u>	<u>Control measures</u>
<b>Added Chemicals:</b>		
Nitrites/nitrates	Cured meats, fish, any food	Do not use more than the
Niacin	exposed to accidental	prescribed amount of curing
	contamination, spinach	compound according to labeling
		(niacin) is not currently approved
	Meat and other foods to which	for use in meat or poultry with or
	sodium nicotinate is added	poultry with or without nitrates or
		nitrates.

1	2	3	4
Flavor enhancers	Asian or Latin American food		Avoid using excessive amounts
Monosodium glutamate(MSG)			
5	6	7	8
Chemicals used in retail establishments (e.g. lubricants, cleaners, sanitizers, cleaning compounds, and paints)	Any food could become contaminated		Address through SOPs for proper labeling, storage, handling, and use of chemicals; retain Material Safety Data Sheets for all chemicals.
9	10	11	12
Allergens	Foods containing or contacted by:		Use a rigorous sanitation regime to prevent cross contact between allergenic and non-allergenic ingredients.
	Milk		
	Egg		
	Fish		
	Crustacean shellfish		
	Tree nuts		
	Wheat		
	Peanuts		
	Soybeans		

18

19 **(5) What are Physical Hazards?**

20 Illness and injury can result from foreign objects in food. These physical hazards  
 21 can result from contamination or poor procedures at many points in the food  
 22 chain from harvest to consumer, including those within the food establishment.  
 23 As establishments develop their food safety management systems, Annex 2,  
 24 Table 3 can be used to aid in the identification of sources of potential physical  
 25 hazards to the food being prepared, served, or sold. Annex 2, Table 3  
 26 provides some examples of common physical hazards.

27

28

29 **Annex 2, Table 3. Main Materials of Concern as Physical Hazards and Common Sources<sup>a, b</sup>**

31 <u>Material</u>	32 <u>Injury Potential</u>	33 <u>Sources</u>
34 Glass fixtures	35 Cuts, bleeding; may require surgery to find or remove	Bottles, jars, lights, utensils, gauge covers
Wood	Cuts, infection, choking; may require surgery to remove	Fields, pallets, boxes, buildings

1	Stones, metal	Choking, broken teeth	Fields, buildings, machinery, wire,
2	fragments	Cuts, infection; may require surgery to	employees
3		remove	
4	Insulation	Choking; long-term if asbestos	Building materials
5	Bone	Choking, trauma	Fields, improper plant processing
6	Plastic	Choking, cuts, infection; may require	Fields, plant packaging materials,
7		surgery to remove	pallets, employees
8	Personal effects	Choking, cuts, broken teeth; may	Employees
9		require surgery to remove

#### **(6) What is the purpose of the hazard analysis principle?**

The purpose of hazard analysis is to develop a list of food safety hazards that are reasonably likely to cause illness or injury if not effectively controlled.

#### **(7) How is the hazard analysis conducted?**

The process of conducting a hazard analysis involves two stages:

1. Hazard Identification
2. Hazard Evaluation

Hazard identification can be thought of as a brain storming session. This stage focuses on identifying the food safety hazards that might be present in the food given the food preparation process used, the handling of the food, the facility, and general characteristics of the food itself. During this stage, a review is made of the ingredients used in the product, the activities conducted at each step in the process, the equipment used, the final product, and its method of storage and distribution, as well as the intended use and consumers of the product. Based on this review, a list of potential biological, chemical, or physical hazards is made at each stage in the food preparation process.

In stage two, the hazard evaluation, each potential hazard is evaluated based on the severity of the potential hazard and its likely occurrence. The purpose of this stage is to determine which of the potential hazards listed in stage one of the

1 hazard analysis warrant control in the HACCP plan. Severity is the seriousness  
2 of the consequences of exposure to the hazard. Considerations made when  
3 determining the severity of a hazard include understanding the impact of the  
4 medical condition caused by the illness, as well as the magnitude and duration of  
5 the illness or injury. Consideration of the likely occurrence is usually based upon  
6 a combination of experience, epidemiological data, and information in the technical  
7 literature. Hazards that are not reasonably likely to occur are not considered in a  
8 HACCP plan. During the evaluation of each potential hazard, the food, its method  
9 of preparation, transportation, storage, and persons likely to consume the product  
10 should be considered to determine how each of these factors may influence the  
11 likely occurrence and severity of the hazard being controlled.

12 Upon completion of the hazard analysis, a list of significant hazards that must be  
13 considered in the HACCP plan is made, along with any measure(s) that can be  
14 used to control the hazards. These measures, called control measures, are  
15 actions or activities that can be used to prevent, eliminate, or reduce a hazard.  
16 Some control measures are not essential to food safety, while others are.  
17 Control measures essential to food safety like proper cooking, cooling, and  
18 refrigeration of ready-to-eat, potentially hazardous foods (time/temperature control  
19 for safety foods) are usually applied at critical control points (CCPs) in the HACCP  
20 plan (discussed later). The term control measure is used because not all hazards  
21 can be prevented, but virtually all can be controlled. More than one control  
22 measure may be required for a specific hazard. Likewise, more than one hazard  
23 may be addressed by a specific control measure (e.g., proper cooking).

## 24 **(B) Principle #2: Determine Critical Control Points (CCPs)**

### 25 **(1) What is the Critical Control Point (CCP)?**

26 A critical control point (CCP) means a point or procedure in a specific food system  
27 where loss of control may result in an unacceptable health risk. Control can be  
28 applied at this point and is essential to prevent or eliminate a food safety hazard  
29 or reduce it to an acceptable level. Each CCP will have one or more control  
30 measures to assure that the identified hazards are prevented, eliminated, or  
31 reduced to acceptable levels. Common examples of CCPs include cooking,

1 cooling, hot holding, and cold holding of ready-to-eat potentially hazardous foods  
2 (time/temperature control for safety foods). Due to vegetative and spore- and toxin-  
3 forming bacteria that are associated with raw animal foods, it is apparent that the  
4 proper execution of control measures at each of these operational steps is  
5 essential to prevent or eliminate food safety hazards or reduce them to acceptable  
6 levels.

7 **(2) Are quality issues considered when determining CCPs?**

8 CCPs are only used to address issues with product safety. Actions taken on  
9 the part of the establishment such as first-in first-out (FIFO) or refrigerating non-  
10 potentially hazardous foods (time/temperature control for safety foods) are to ensure  
11 food quality rather than food safety and therefore should not be considered as  
12 CCPs unless they serve a dual-purpose of ensuring food safety.

13 **(3) Are the CCPs the same for everyone?**

14 Different facilities preparing similar food items may identify different hazards and  
15 the CCPs. This can be due to differences in each facility's layout, equipment,  
16 selection of ingredients, and processes employed. In mandatory HACCP systems,  
17 there may be rigid regulatory requirements regarding what must be designated a  
18 CCP. In voluntary HACCP systems, hazard control may be accomplished at  
19 CCPs or through prerequisite programs. For instance, one facility may decide that  
20 it can best manage the hazards associated with cooling through a standardized  
21 procedure in its prerequisite programs rather than at a CCP in its HACCP plan.  
22 One tool that can be used to assist each facility in the identification of CCPs  
23 unique to its operation is a CCP decision tree.

Decision Tree adapted from NACMCF.

1           **(C) Principle #3: Establish Critical Limits**

2           **(1) What is a critical limit and what is its purpose?**

3           A critical limit is a prescribed parameter (e.g., minimum and/or maximum value)  
4           that must be met to ensure that food safety hazards are controlled at each  
5           CCP. A critical limit is used to distinguish between safe and unsafe  
6           operating conditions at a CCP. Each control measure at a CCP has one or  
7           more associated critical limits. Critical limits may be based upon factors like  
8           temperature, time, moisture level, water activity ( $a_w$ ), or pH. They must be  
9           scientifically-based and measurable.

10          **(2) What are examples of critical limits?**

11          Examples of critical limits are the time/temperature parameters for cooking  
12          chicken (165 °F for 15 seconds). In this case, the critical limit designates the  
13          *minimum* criteria required to eliminate food safety hazards or reduce them to  
14          an acceptable level. The critical limit for the acidification of sushi rice, a pH  
15          of  $\leq 4.6$ , sets the *maximum* limit for pH necessary to control the growth of  
16          spore - and toxin - forming bacteria. Critical limits may be derived from  
17          regulatory standards such as the FDA *Food Code*, other applicable  
18          guidelines, performance standards, or experimental results.

19          **(D) Principle #4: Establish Monitoring Procedures**

20          **(1) What is the purpose of monitoring?**

21          Monitoring is the act of observing and making measurements to help  
22          determine if critical limits are being met and maintained. It is used to  
23          determine whether the critical limits that have been established for each  
24          CCP are being met.

25          **(2) What are examples of monitoring activities?**

26          Examples of monitoring activities include visual observations and  
27          measurements of time, temperature, pH, and water activity. If cooking  
28          chicken is determined to be a CCP in an operation, then monitoring the  
29          internal temperature of a select number of chicken pieces immediately  
30          following the cook step would be an example of a monitoring activity.

1 Alternatively, the temperature of an oven or fryer and the time required to  
2 reach an internal temperature of 165 °F could also be monitored.

### 3 **(3) How is monitoring conducted?**

4 Typically, monitoring activities fall under two broad categories:

- 5 • measurements
- 6 • observations

7 Measurements usually involve time and temperature but also include other  
8 parameters such as pH. If an operation identifies the acidification of sushi  
9 rice as a CCP and the critical limit as the final pH of the product being  
10  $\leq 4.6$ , then the pH of the product would be measured to ensure that the  
11 critical limit is met.

12 Observations involve visual inspections to monitor the presence or absence  
13 of a food safety activity. If date marking is identified as a CCP in a deli  
14 operation for controlling *Listeria monocytogenes* in ready-to-eat deli meats,  
15 then the monitoring activity could involve making visual inspections of the date  
16 marking system to monitor the sell, consume, or discard dates.

### 17 **(4) How often is monitoring conducted?**

18 Monitoring can be performed on a continuous or intermittent basis. Continuous  
19 monitoring is always preferred when feasible as it provides the most complete  
20 information regarding the history of a product at a CCP. For example, the  
21 temperature and time for an institutional cook-chill operation can be recorded  
22 continuously on temperature recording charts.

23 If intermittent monitoring is used, the frequency of monitoring should be  
24 conducted often enough to make sure that the critical limits are being met.

### 25 **(5) Who conducts monitoring?**

26 Individuals directly associated with the operation (e.g., the person in charge  
27 of the establishment, chefs, and departmental supervisors) are often selected  
28 to monitor CCPs. They are usually in the best position to detect deviations  
29 and take corrective actions when necessary. These employees should be  
30 properly trained in the specific monitoring techniques and procedures used.

1           **(E) Principle #5: Establish Corrective Actions**

2           **(1) What are corrective actions?**

3           Corrective actions are activities that are taken by a person whenever a  
4           critical limit is not met. Discarding food that may pose an unacceptable food  
5           safety risk to consumers is a corrective action. However, other corrective  
6           actions such as further cooking or reheating a product can be used provided  
7           food safety is not compromised. For example, a restaurant may be able to  
8           continue cooking hamburgers that have not reached an internal temperature  
9           of 155 °F for 15 seconds until the proper temperature is met. Clear  
10          instructions should be developed detailing who is responsible for performing  
11          the corrective actions, the procedures to be followed, and when.

12          **(F) Principle #6: Establish Verification Procedures**

13          **(1) What is verification?**

14          Verification includes those activities, other than monitoring, that determine the  
15          validity of the HACCP plan and show that the system is operating according  
16          to the plan. Validation is a component of verification which focuses on  
17          collecting and evaluating scientific and technical information to determine if  
18          the HACCP system, when properly implemented, will effectively control the  
19          hazards. Clear instructions should be developed detailing who is responsible  
20          for conducting verification, the frequency of verification, and the procedures  
21          used.

22          **(2) What is the frequency of verification activities? What are some**  
23          **examples of verification activities?**

24          Verification activities are conducted frequently, such as daily, weekly,  
25          monthly, and include the following:

- 26                 •       observing the person doing the monitoring and determining  
27                         whether monitoring is being done as planned
- 28                 •       reviewing the monitoring records to determine if they are  
29                         completed accurately and consistently

- 1 • determining whether the records show that the frequency  
2 of monitoring stated in the plan is being followed
- 3 • ensuring that corrective action was taken when the  
4 person monitoring found and recorded that the critical  
5 limit was not met
- 6 • validating that the critical limits are achieving the desired  
7 results of controlling the identified hazard
- 8 • confirming that all equipment, including equipment used  
9 for monitoring, is operated, maintained, and calibrated  
10 properly.

## 11 **(G) Principle #7: Establish Record Keeping Procedures**

### 12 **(1) Why are records important?**

13 Maintaining documentation of the activities in a food safety  
14 management system can be vital to its success. Records provide  
15 documentation that appropriate corrective actions were taken when  
16 critical limits were not met. In the event that an establishment is  
17 implicated in a foodborne illness, documentation of activities related to  
18 monitoring and corrective actions can provide proof that reasonable care  
19 was exercised in the operation of the establishment. Documenting  
20 activities provides a mechanism for verifying that the activities in the  
21 HACCP plan were properly completed. In many cases, records can  
22 serve a dual purpose of ensuring quality and food safety.

### 23 **(2) What types of records are maintained as part of a food safety 24 management system?**

25 There are at least 5 types of records that could be maintained to support a  
26 food safety management system:

- 27 • records documenting the activities related to the prerequisite  
28 programs
- 29 • monitoring records
- 30 • corrective action records

- verification and validation records
- calibration records.

#### **4. THE PROCESS APPROACH – A PRACTICAL APPLICATION OF HACCP AT RETAIL TO ACHIEVE ACTIVE MANAGERIAL CONTROL**

##### **(A) Why Focus on HACCP Principles at Retail and Food Service?**

FDA recognizes that there are important differences between using HACCP principles in a food safety management system developed for food manufacturing plants and applying these same principles in food safety management system developed for use in retail and food service establishments.

Since the 1980's, operators and regulators have been exploring the use of the HACCP principles in restaurants, grocery stores, institutional care facilities, and other retail food establishments. During this time, much has been learned about how these principles can be used in these varied operations, collectively referred to as retail food establishments. Most of this exploration has centered around the focal question of how to stay true to the NACMCF definitions of HACCP and still make the principles useful to an industry that encompasses the broadest range of conditions.

Unlike industries such as canning, other food processing, and dairy plants, the retail industry is not easily defined by specific commodities or conditions. Consider the following characteristics that retail food establishments share that set them apart from most food processors:

1. Employee and management turnover is exceptionally high in food establishments, especially for entry level positions. This means the many employees or managers have little experience and food safety training must be continuously provided.
2. Many establishments are start-up businesses operating without benefit of a large corporate support structure and having a relatively low profit margin and perhaps less capital to work with than other segments of the food industry.

1 3. There is an almost endless number of production techniques,  
2 products, menu items, and ingredients used which are not easily  
3 adapted to a simple, standardized approach. Changes occur  
4 frequently and little preparation time is available.

5 FDA fully recognizes the diversity of retail and food service establishments  
6 and their varying in-house resources to implement HACCP. That recognition  
7 is combined with an understanding that the success of such implementation  
8 is dependent upon establishing realistic and useful food safety strategies that  
9 are customized to the operation.

10 **(B) What is the Process Approach?**

11 When conducting the hazard analysis, food manufacturers usually use food  
12 commodities as an organizational tool and follow the flow of each product.  
13 This is a very useful approach for producers or processors since they are  
14 usually handling one product at a time. By contrast, in retail and food  
15 service operations, foods of all types are worked together to produce the  
16 final product. This makes a different approach to the hazard analysis  
17 necessary. Conducting the hazard analysis by using the food preparation  
18 processes common to a specific operation is often more efficient and useful  
19 for retail and food service operators. This is called the “process approach”  
20 to HACCP.

21 The process approach can best be described as dividing the many food  
22 flows in an establishment into broad categories based on activities or stages  
23 in the preparation of the food, then analyzing the hazards, and placing  
24 managerial controls on each grouping.

25 **(C) What are the three food preparation processes most often used**  
26 **in retail and food service establishments and how are they**  
27 **determined?**

28 The flow of food in a retail or food service establishment is the path that  
29 food follows from receiving through service or sale to the consumer.  
30 Several activities or stages make up the flow of food and are called

1 operational steps. Examples of operational steps include receiving, storing,  
2 preparing, cooking, cooling, reheating, holding, assembling, packaging, serving,  
3 and selling. The terminology used for operational steps may differ between  
4 food service and retail food store operations.

5 Most food items produced in a retail or food service establishment can be  
6 categorized into one of three preparation processes based on the number of  
7 times the food passes through the temperature danger zone between 41°F  
8 and 135°F:

9 • **Process 1: Food Preparation with No Cook Step**

10 **Example flow: Receive – Store – Prepare – Hold – Serve**

11 (other food flows are included in this process, but there is no cook  
12 step to destroy pathogens)

13 • **Process 2: Preparation for Same Day Service**

14 **Example flow: Receive – Store – Prepare – Cook – Hold – Serve**

15 (other food flows are included in this process, but there is only one  
16 trip through the temperature danger zone)

17 • **Process 3: Complex Food Preparation**

18 **Example flow: Receive – Store – Prepare – Cook – Cool – Reheat – Hot**  
19 **Hold – Serve**

20 (other food flows are included in this process, but there are always  
21 two or more complete trips through the temperature danger zone)

22 A summary of the three food preparation processes in terms of number of  
23 times through the temperature danger zone can be depicted in a Danger  
24 Zone diagram. Although foods produced using process 1 may *enter* the  
25 danger zone, they do not pass all the way through it. Foods that go  
26 through the danger zone only once are classified as Same Day Service,  
27 while foods that go through more than once are classified as Complex food  
28 preparation.

1  
 2 The three food preparation processes conducted in retail and food service  
 3 establishments are not intended to be all-inclusive. For instance, quick service  
 4 facilities may have “cook and serve” processes specific to their operation.  
 5 These processes are likely to be different from the “Same Day Service”  
 6 preparation processes in full service restaurants since many of their foods  
 7 are generally cooked and hot held before service. In addition, in retail food  
 8 stores, operational steps such as packaging and assembly may be included  
 9 in all of the food preparation processes before the product is sold to the  
 10 consumer. It is also very common for a retail or food service operator to  
 11 use multiple food preparation processes to create a single menu item.

12 **(D) How is a hazard analysis conducted in process HACCP?**

13 In the process approach to HACCP, conducting a hazard analysis on  
 14 individual food items is time and labor intensive and is generally unnecessary.  
 15 Identifying and controlling the hazards in each food preparation process  
 16 achieves the same control of risk factors as preparing a HACCP plan for  
 17 each individual product.

18 Example: An establishment has dozens of food items (including baked

1 chicken and baked meatloaf) in the “Preparation for Same Day Service”  
2 category. Each of the food items may have unique hazards, but regardless  
3 of the individual hazards, control via proper cooking and holding will  
4 generally ensure the safety of all of the foods in this category. An  
5 illustration of this concept follows:

- 6 • Even though they have unique hazards, baked chicken and  
7 meatloaf are items frequently grouped in the “Same Day  
8 Service” category (Process 2).
- 9 • *Salmonella* spp. and *Campylobacter*, as well as spore-formers,  
10 such as *Bacillus cereus* and *Clostridium perfringens*, are  
11 significant biological hazards in chicken.
- 12 • Significant biological hazards in meatloaf include *Salmonella*  
13 spp., *E. coli* O157:H7, *Bacillus cereus*, and *Clostridium*  
14 *perfringens*.
- 15 • Despite their different hazards, the control measure used to kill  
16 pathogens in both these products is cooking to the proper  
17 temperature.
- 18 • Additionally, if the products are held after cooking, then proper  
19 hot holding or time control is also required to prevent the  
20 outgrowth of spore-formers that are not destroyed by cooking.

21 As with product-specific HACCP, critical limits for cooking remain specific to  
22 each food item in the process. In the scenario described above, the cooking  
23 step for chicken requires a final internal temperature of 165°F for 15  
24 seconds to control the pathogen load for *Salmonella* spp. Meatloaf, on the  
25 other hand, is a ground beef product and requires a final internal  
26 temperature of 155°F for 15 seconds to control the pathogen load for both  
27 *Salmonella* spp. and *E. coli* O157:H7. Some operational steps such as  
28 refrigerated storage or hot holding have critical limits that apply to all foods.

1 Annex 2, Table 4 further illustrates this concept. Note that the only unique  
2 control measure applies to the critical limit of the cooking step for each of  
3 the products. Other food safety hazards and control measures may exist  
4 that are not depicted here:

**Annex 2, Table 4: Examples of Hazards and Control Measures for Same Day Service Items**

**Process 2: Preparation for Same Day Service**

<b><u>Example Products</u></b>	<b><u>Baked Meatloaf</u></b>	<b><u>Baked Chicken</u></b>
<b>Example Biological Hazards</b>	<i>Salmonella</i> spp.	<i>Salmonella</i> spp.
	<i>E. coli</i> O157:H7	<i>Campylobacter</i>
	<i>Clostridium perfringens</i>	<i>Clostridium perfringens</i>
	<i>Bacillus cereus</i>	<i>Bacillus cereus</i>
	Various fecal-oral route pathogens	Various fecal-oral route pathogens
<b>Example Control Measures</b>	Refrigeration at 41°F or below	Refrigeration at 41°F or below
	Cooking at 155°F for 15 seconds	Cooking at 165°F for 15 seconds
	Hot Holding at 135°F or above OR Time Control	Hot Holding at 135°F or above OR Time Control
	Good personal hygiene (No bare hand contact with RTE food, proper handwashing, exclusion/restriction of ill employees)	Good personal hygiene (No bare hand contact with RTE food, proper handwashing, exclusion/restriction of ill employees)

RTE = ready-to-eat food

**(E) How is the process approach helpful to industry in determining the measures that must be implemented to actively manage the foodborne illness risk factors that result in out-of-control hazards?**

Even though variations in foods and in the three food preparation process

1 flows used to prepare them are common, the control measures will generally  
2 be the same based on the number of times the food goes through the  
3 temperature danger zone. Several of the most common control measures  
4 associated with each food preparation process are discussed in this Annex.  
5 Retail or food service establishments should use these simple control  
6 measures as the core of their food safety management systems; however,  
7 there may be other risk factors unique to an operation or process that are  
8 not listed here. Each operation should be evaluated independently.

9 In developing a voluntary food safety management system, active managerial  
10 control of risk factors common to each process can be achieved by  
11 implementing control measures at certain operational steps designated as  
12 critical control points (CCPs) or by implementing prerequisite programs. This  
13 is explained in more detail in the Operator's Manual discussed in Part 5 of  
14 this Annex.

#### 15 **(F) Facility-wide Considerations**

16 In order to have active managerial control over personal hygiene and cross-  
17 contamination, certain control measures must be implemented in all phases  
18 of the operation. All of the following control measures should be  
19 implemented regardless of the food preparation process used:

- 20 • **No bare hand contact with ready-to-eat foods (or use of a pre-**  
21 **approved, alternative procedure)** to help prevent the transfer of  
22 viruses, bacteria, or parasites from hands to food
- 23 • **Proper handwashing** to help prevent the transfer of viruses, bacteria,  
24 or parasites from hands to food
- 25 • **Restriction or exclusion of ill employees** to help prevent the  
26 transfer of viruses, bacteria, or parasites from hands to food
- 27 • **Prevention of cross-contamination** of ready-to-eat food or clean and  
28 sanitized food-contact surfaces with soiled cutting boards, utensils,  
29 aprons, etc., or raw animal foods.

1           **(G) Food Preparation Process 1 – Food Preparation with No Cook Step**

2           Example Flow: RECEIVE → STORE → PREPARE → HOLD → SERVE

3           Several food flows are represented by this particular process. Many of  
4           these food flows are common to both retail food stores and food service  
5           facilities, while others only apply to retail operations. Raw, ready-to-eat food  
6           like sashimi, raw oysters, and salads are grouped in this category.  
7           Components of these foods are received raw and will not be cooked before  
8           consumption.

9           Foods cooked at the processing level but that undergo no further cooking at  
10          the retail level before being consumed are also represented in this category.  
11          Examples of these kinds of foods are deli meats, cheeses, and other  
12          pasteurized dairy products (such as yogurt). In addition, foods that are  
13          received and sold raw but are to be cooked by the consumer after  
14          purchase, e.g., hamburger meat, chicken, and steaks, are also included in  
15          this category.

16          All the foods in this category lack a cook step *while at the retail or food*  
17          *service facility*; thus, there are no complete trips through the danger zone.  
18          Purchase specifications can be required by the retail or food service  
19          establishment to ensure that foods are received as safe as possible.  
20          Without a kill step to destroy pathogens, preventing further contamination by  
21          ensuring that employees follow good hygienic practices is an important  
22          control measure.

23          Cross-contamination must be prevented by properly storing ready-to-eat food  
24          away from raw animal foods and soiled equipment and utensils. Foodborne  
25          illness may result from ready-to-eat food being held at unsafe temperatures  
26          for long periods of time due to the outgrowth of bacteria.

27          In addition to the facility-wide considerations, a food safety management  
28          system involving this food preparation process should focus on ensuring  
29          active managerial control over the following:

- 30           •       **Cold holding or using time alone** to control bacterial growth

1 and toxin production

- 2 • **Food source** (e.g., shellfish due to concerns with viruses, natural  
3 toxins, and *Vibrio* and for certain marine finfish intended for raw  
4 consumption due to concerns with ciguatera toxin)
- 5 • **Receiving temperatures** (e.g., certain species of marine finfish  
6 due to concerns with scombrototoxin)
- 7 • **Date marking** of ready-to-eat PHF (TCS food) held for more  
8 than 24 hours to control the growth of psychrophiles such as  
9 *Listeria monocytogenes*
- 10 • **Freezing** certain species of fish intended for raw consumption  
11 due to parasite concerns
- 12 • **Cooling** from ambient temperature to prevent the outgrowth of  
13 spore-forming or toxin-forming bacteria.

14 **(H) Food Preparation Process 2 – Preparation for Same Day Service**

15 Example Flow: RECEIVE → STORE → PREPARE → COOK → HOLD → SERVE

16 In this food preparation process, food passes through the danger zone only  
17 once in the retail or food service facility before it is served or sold to the  
18 consumer. Food is usually cooked and held hot until served, e.g., fried  
19 chicken, but can also be cooked and served immediately. In addition to the  
20 facility-wide considerations, a food safety management system involving this  
21 food preparation process should focus on ensuring active managerial control  
22 over the following:

- 23 • **Cooking** to destroy bacteria and parasites
- 24 • **Hot holding or using time alone** to prevent the outgrowth of  
25 spore-forming bacteria.

26 Approved food source, proper receiving temperatures, and proper cold  
27 holding before cooking would also be important if dealing with certain marine  
28 finfish due to concerns with ciguatera toxin and scombrototoxin.

1           **(I) Food Preparation Process 3 – Complex Food Preparation**

2           Example Flow: RECEIVE →STORE→PREPARE→COOK→ COOL→  
3                           REHEAT →HOT HOLD → SERVE

4           Foods prepared in large volumes or in advance for next day service usually  
5           follow an extended process flow. These foods pass through the temperature  
6           danger zone more than one time; thus, the potential for the growth of spore-  
7           forming or toxigenic bacteria is greater in this process. Failure to  
8           adequately control food product temperatures is one of the most frequently  
9           encountered risk factors contributing to foodborne illness. Food handlers  
10          should minimize the time foods are at unsafe temperatures.

11          In addition to the facility-wide considerations, a food safety management  
12          system involving this food preparation process should focus on ensuring  
13          active managerial control over the following:

- 14           •     **Cooking** to destroy bacteria and parasites
- 15           •     **Cooling** to prevent the outgrowth of spore-forming or toxin-  
16           forming bacteria
- 17           •     **Hot and cold holding or using time alone** to control bacterial  
18           growth and toxin formation
- 19           •     **Date marking** of ready-to-eat PHF (TCS food) held for more  
20           than 24 hours to control the growth of psychrophiles such as  
21           *Listeria monocytogenes*
- 22           •     **Reheating** for hot holding, if applicable.

23          Approved food source, proper receiving temperatures, and proper cold  
24          holding before cooking would also be important if dealing with certain marine  
25          finfish due to concerns with ciguatera toxin and scombrototoxin.

26          **5. FDA RETAIL HACCP MANUALS**

27          **(A) What guidance has been developed by FDA to assist operators of**  
28          **retail and food service establishments in achieving active**  
29          **managerial control of foodborne illness risk factors?**

30          FDA, in partnership with Federal, State, and local regulators, industry,

1 academia, and consumers, has written a guidance document entitled,  
2 *“Managing Food Safety: A Manual for the Voluntary Use of HACCP*  
3 *Principles for Operators of Food Service and Retail Establishments.”*  
4 Commonly referred to as the “Operator’s Manual,” this document is designed  
5 to assist operators with developing or enhancing food safety management  
6 systems based on the process approach to HACCP. The manual presents a  
7 step-by-step procedure for writing and voluntarily implementing a food safety  
8 management system based on the principles of HACCP. The desired outcome is  
9 an operator who employs a preventive rather than a reactive strategy to food  
10 safety.

11 The Operator’s Manual embodies FDA’s current thinking on the application  
12 of HACCP principles at retail. It advocates the voluntary use of HACCP  
13 principles using the process approach as a practical and effective means of  
14 reducing the occurrence of foodborne illness risk factors leading to out-of-  
15 control hazards. The Operator’s Manual is strictly for the voluntary  
16 implementation of HACCP principles at retail and should not be used to  
17 develop HACCP plans that are required through Federal, State, or local  
18 regulations, ordinances, or laws. The document can be found on the FDA  
19 website at <http://www.cfsan.fda.gov/~tcjm/hret2toc.html>.

20 **(B) What guidance has been developed by FDA to assist regulators**  
21 **of retail and food service establishments in assessing industry’s**  
22 **active managerial control of foodborne illness risk factors?**

23 FDA has written a document for regulators of retail and food service  
24 establishments entitled, *“Managing Food Safety: A Regulator’s Manual for*  
25 *Applying HACCP Principles to Risk-Based Retail and Food Service*  
26 *Inspections and Evaluating Voluntary Food Safety Management Systems.”*  
27 Commonly referred to as the “Regulator’s Manual,” this document was written  
28 to provide a risk-based inspectional “roadmap” for evaluating the degree of  
29 active managerial control an operator has over foodborne illness risk factors.

1 In addition, the manual advocates the use of voluntary intervention strategies,  
2 including the development of food safety management systems or risk control  
3 plans to bring about a long-term behavior change that will result in a  
4 reduction in the occurrence of risk factors. In cases where an operator may  
5 want their inspector to provide them with feedback on their voluntarily-  
6 implemented food safety management system, the manual provides regulators  
7 with information on how to validate and verify an existing system.

8 The document can be found on the FDA website at:  
9 <http://www.cfsan.fda.gov/~tcjm/hret3toc.html>.

10 Annex 3 of the Guam Food Code outlines the basis for conducting  
11 successful risk-based inspections and is provided to assist industry in  
12 achieving active managerial control of foodborne illness risk factors as  
13 outlined in the draft *Recommended National Retail Food Regulatory Program*  
14 *Standards* and the *Regulator's Manual*.

## 15 **6. ADVANTAGES OF USING THE PRINCIPLES OF HACCP**

### 16 **(A) What advantages does using HACCP principles offer operators of** 17 **retail and food service establishments?**

18 Rather than relying solely on periodic feedback from inspections by regulatory  
19 agencies, an establishment operator who implements a food safety  
20 management system based on HACCP principles emphasizes continuous  
21 problem solving and prevention. Additionally, HACCP enhances and  
22 encourages communication between industry and regulators.

23 A food safety management system based on HACCP principles offers many  
24 other advantages to industry. One advantage is that such a system may  
25 provide a method for achieving active managerial control of multiple risk  
26 factors associated with an entire operation. Other advantages include:

- 27 • Reduction in product loss
- 28 • Increase in product quality

- Better inventory control
- Consistency in product preparation
- Increase in profit
- Increased employee awareness and participation in food safety

**(B) What advantages does using HACCP principles offer regulators of retail and food service establishments?**

Traditional inspections are relatively resource-intensive, inefficient, and reactive rather than preventive in nature. Using traditional inspection techniques allows for a satisfactory “snapshot” assessment of the requirements of the code at the time of the inspection. Unfortunately, unless an inspector asks questions and inquires about the activities and procedures being utilized by the establishment even at times when the inspector is not there, there is no way to know if an operator is achieving *active* managerial control.

With the limited time often available for conducting inspections, regulators must focus their attention on those areas that clearly have the greatest impact on food safety – foodborne illness risk factors. By knowing that there are only a few control measures that are essential to food safety and focusing on these during the inspection, an inspector can assess the operator’s active managerial control of the foodborne illness risk factors.

Regulators can provide invaluable feedback to an operator through their routine inspections. This is especially useful when utilizing a risk-based approach. By incorporating HACCP principles into routine inspections, an inspector can provide an operator with the constructive input needed to establish the control system necessary to bring the foodborne illness risk factors back under continuous control.

**7. SUMMARY**

In order to make a positive impact on foodborne illness, retail and food service operators must achieve active managerial control of the risk factors contributing to foodborne illness. Combined with basic sanitation, employee

1 training, and other prerequisite programs, the principles of HACCP provide  
2 an effective system for achieving this objective.

3 The goal in applying HACCP principles in retail and food service is to have  
4 the operator take purposeful actions to ensure safe food. The process  
5 approach simplifies HACCP principles for use in retail and food service. This  
6 practical and effective method of hazard control embodies the concept of  
7 active managerial control by providing an on-going system of simple control  
8 measures that will reduce the occurrence of risk factors that lead to out-of-  
9 control hazards.

10 The role of retail and food service regulatory professionals is to conduct  
11 risk-based inspections using HACCP principles to assess the degree of control  
12 industry has over the foodborne illness risk factors. Regulators can assist  
13 industry in achieving active managerial control of risk factors by using a risk-  
14 based inspection approach to identify strengths and weaknesses and  
15 suggesting possible solutions and improvements.

## 16 **8. ACKNOWLEDGEMENTS**

17 Much of this Annex is adapted from the National Advisory Committee on  
18 Microbiological Criteria for Foods, Hazard Analysis and Critical Control Point  
19 Principles and Guidelines, adopted August 14, 1997.

20 The physical hazards table (Table 3) was provided courtesy of “Overview of  
21 Biological, Chemical, and Physical Hazards” in “HACCP Principles and  
22 Applications,” Merle Pierson and Donald A. Corlett, Jr. (Eds.), 1992. p. 8-28.  
23 Chapman and Hall, New York.

24 Based on a recommendation from the Retail HACCP Committee of the  
25 Conference for Food Protection, the two HACCP Manuals have been  
26 endorsed by the Conference.

12

13 **1. PURPOSE AND SCOPE**

14 This Annex provides regulatory program managers and front-line inspection  
15 staff with guidance on planning, scheduling, conducting, and evaluating  
16 risk-based inspections. The draft *FDA’s Recommended National Retail*  
17 *Food Regulatory Program Standards* (Program Standards) (revised April  
18 2003) (<http://www.cfsan.fda.gov/~dms/ret-toc.html>) provide additional  
19 recommendations to assist regulatory program managers in the planning  
20 and development of a risk-based inspection program.

21 The primary focus of this Annex is to provide inspectors with methods for  
22 conducting risk-based inspections. Various strategies that can be used by  
23 regulatory professionals to assist operators in achieving active managerial  
24 control of foodborne illness risk factors are also included in this Annex.

25 As presented in Annex 2 of the Guam Food Code, the Centers for  
26 Disease Control and Prevention (CDC) Surveillance Report for 1993-1997,  
27 “Surveillance for Foodborne Disease Outbreaks – United States”  
28 (<http://www.cdc.gov/mmwr/preview/mmwrhtml/ss4901a1.htm>) identifies the  
29 most frequently reported contributing factors to foodborne illness. Five of  
30 these broad categories of contributing factors directly relate to food safety

1 concerns within retail and food service establishments and are collectively  
2 termed by the FDA as “foodborne illness risk factors.” These five broad  
3 categories are:

- 4 • Food from Unsafe Sources
- 5 • Inadequate Cooking
- 6 • Improper Holding Temperatures
- 7 • Contaminated Equipment
- 8 • Poor Personal Hygiene.

9 The FDA manual, *Managing Food Safety: A Regulator’s Manual for*  
10 *Applying HACCP Principles to Risk-based Retail and Food Service*  
11 *Inspections and Evaluating Voluntary Food Safety Management Systems*  
12 (FDA’s Regulator’s Manual) (<http://www.cfsan.fda.gov/~dms/hret3toc.html>),  
13 provides additional information on conducting risk-based inspections. Annex  
14 2 of the Guam Food Code provides additional information on Hazard  
15 Analysis and Critical Control Point (HACCP) principles and the process  
16 approach to HACCP. It should be reviewed in conjunction with the material  
17 found in this Annex to better prepare for performing risk-based inspections.

18 The “Retail Food Program Resource Guide,” a CD-ROM containing pertinent  
19 FDA documents referenced in this Annex, is available for use by federal,  
20 state, local, and tribal regulatory agencies. It is produced by and available  
21 through FDA Regional Retail Food Specialists or the FDA Division of  
22 Federal-State Relations (HFC-150); U.S. Food and Drug Administration;  
23 5600 Fishers Lane, Room 12-07; Rockville, Maryland 20857; PHONE (301)  
24 827-6906; (FAX) (301) 443-2143.

## 26 **2. RISK-BASED ROUTINE INSPECTIONS**

27 Inspections have been a part of food safety regulatory activities since the  
28 earliest days of public health. The term “routine inspection” has been used  
29 to describe periodic inspections conducted as part of an on-going  
30 regulatory scheme.

1 Program managers should strive to have adequate staffing and resources  
2 to allow all inspectors ample time to thoroughly evaluate establishments  
3 and ask as many questions as needed to fully understand establishments'  
4 operations. For most jurisdictions, however, inspectors continue to have  
5 limited time in which to complete inspections. This does not negate the  
6 need to thoroughly identify and assess the control of foodborne illness risk  
7 factors during each inspection.

8 It is a false assumption that inspectors cannot conduct risk-based  
9 inspections in a limited timeframe. Even with limited time, inspectors can  
10 focus their inspections on assessing the degree of active managerial  
11 control an operator has over the foodborne illness risk factors. By  
12 focusing inspections on the control of foodborne illness risk factors,  
13 inspectors can be assured that they are making a great impact on  
14 reducing foodborne illness.

15 As described in Annex 2, active managerial control means the purposeful  
16 incorporation of specific actions or procedures by industry management  
17 into the operation of their businesses to attain control over foodborne  
18 illness risk factors. It embodies a preventive rather than reactive approach to  
19 food safety through a continuous system of monitoring and verification.

20 Developing and implementing food safety management systems to prevent,  
21 eliminate, or reduce the occurrence of foodborne illness risk factors is  
22 recommended to achieve active managerial control. Regulatory inspections  
23 and follow-up activities must be proactive by using an inspection process  
24 designed to evaluate the implementation of Food Code interventions and  
25 the degree of active managerial control that retail and foodservice  
26 operators have over foodborne illness risk factors. The five Food Code  
27 interventions below were new interventions introduced with the 1993 Food  
28 Code and they are just as important today as they were in 1993. They  
29 encompass a wide-range of control measures specifically designed to  
30 protect consumer health:

- 31 • Demonstration of Knowledge

- 1 • Implementation of Employee Health Policies
- 2 • Hands as a Vehicle of Contamination
- 3 • Time/Temperature Relationships
- 4 • Consumer Advisory.

5 When Food Code interventions are not being implemented or if behaviors,  
6 activities, or procedures likely to cause foodborne illness are observed,  
7 inspectors should verify that the operator takes immediate corrective action  
8 so that consumers do not become sick or injured. Observations made on  
9 the day of the inspection, as well as information gained about the  
10 behaviors, activities, and procedures that occur at other times, allow  
11 inspectors to assess the strengths and weaknesses of the food safety  
12 management system that is in place.

13 An operator should be made aware of the inspectional findings both  
14 during, and at the conclusion of, the inspection and strategies for  
15 achieving compliance in the future should be discussed. Corrective actions  
16 taken during the inspection and repeat violations should be noted on the  
17 inspection report. Repeat violations should trigger further compliance and  
18 enforcement actions.

19 The inspection process is also an opportunity to educate the operator on  
20 the public health reasons supporting the Code requirements. If operators  
21 are afforded the chance to ask questions about general food safety  
22 matters, they may clearly understand the public health significance of non-  
23 compliance.

24 Lastly, if the operator demonstrates a history of violations related to  
25 foodborne illness risk factors, the inspection process can be used to assist  
26 the operator with implementing long-term control systems to prevent those  
27 risk factors from occurring in the future.

### 29 **3. WHAT IS NEEDED TO PROPERLY CONDUCT A RISK-BASED** 30 **INSPECTION?**

#### 31 **A. Schedule Inspections Based on Risk**

1 Studies have shown that the types of food served, the food preparation  
2 processes used, the volume of food, and the population served all has a  
3 bearing on the occurrence of foodborne illness risk factors in retail and  
4 foodservice establishments. Standard 3 of the Program Standards requires  
5 that regulatory jurisdictions develop and use a process that groups food  
6 establishments into at least three categories based on potential and  
7 inherent food safety risks. In addition, Standard 3 requires that regulatory  
8 jurisdictions assign inspection frequency based on the risk categories to  
9 focus program resources on food operations with the greatest food safety  
10 risk. With limited resources, creating a variable inspection frequency for  
11 each category will allow inspection staff to effectively spend more time in  
12 high risk establishments that pose the greatest potential risk of causing  
13 foodborne illness.

14 Table 1 of this Annex provides an example of risk categories and  
15 assignment of inspection frequency based on risk. In this example, the  
16 type of food served, food preparation processes conducted, and history of  
17 compliance related to foodborne illness risk factors are used as the basis  
18 of categorizing risk. Each jurisdiction is encouraged to develop risk  
19 categories tailored to their specific program needs and resources and to  
20 reassess the risk categories on an annual basis.

21 Regardless of the risk category initially assigned to food establishments,  
22 regulatory jurisdictions sometimes consider whether the establishment has  
23 implemented a voluntary food safety management system like HACCP, to  
24 justify a decrease in inspection frequency. Likewise, the following factors  
25 are among many that regulatory jurisdictions sometimes use to justify an  
26 increase in inspection frequency:

- 27 • History of non-compliance with provisions related to foodborne  
28 illness risk factors or critical items
- 29 • Specialized processes conducted
- 30 • Food preparation a day in advance of service
- 31 • Large number of people served

1  
2  
3

- History of foodborne illness and/or complaints
- Highly susceptible population served.

**Annex 3, Table 1. Risk Categorization of Food Establishments**

<u>RISK</u> <u>CATEGORY</u>	<u>DESCRIPTION</u>	<u>FREQUENCY</u> <u>#/YR</u>
1	Examples include most convenience store operations, hot dog carts, and coffee shops. Establishments that serve or sell only pre-packaged, nonpotentially hazardous foods (non time/temperature control for safety (TCS) foods). Establishments that prepare only nonpotentially hazardous foods (nonTCS foods). Establishments that heat only commercially processed, potentially hazardous foods (TCS foods) for hot holding. No cooling of potentially hazardous foods (TCS foods). Establishments that would otherwise be grouped in Category 2 but have shown through historical documentation to have achieved active managerial control of foodborne illness risk factors.	1
2	Examples may include retail food store operations, schools not serving a highly susceptible population, and quick service operations. Limited menu. Most products are prepared/cooked and served immediately. May involve hot and cold holding of potentially hazardous foods (TCS foods) after preparation or cooking. Complex preparation of potentially hazardous foods (TCS foods) requiring cooking, cooling, and reheating for hot holding is limited to only a few potentially hazardous foods (TCS foods). Establishments that would otherwise be grouped in Category 3 but have shown through historical documentation to have achieved active managerial control of foodborne illness risk factors. Newly permitted establishments that would otherwise be grouped in Category 1 until history of active managerial control of foodborne illness risk factors is achieved and documented.	2
3	An example is a full service restaurant. Extensive menu and handling of raw ingredients. Complex preparation including cooking, cooling, and reheating for hot holding involves many potentially hazardous foods (TCS foods). Variety of processes	3

1 require hot and cold holding of potentially hazardous food  
2 (TCS food). Establishments that would otherwise be grouped  
3 in Category 4 but have shown through historical documentation  
4 to have achieved active managerial control of foodborne illness  
5 risk factors. Newly permitted establishments that would  
6 otherwise be grouped in Category 2 until history of active  
7 managerial control of foodborne illness risk factors is achieved  
8 and documented.

---

9 4 Examples include preschools, hospitals, nursing homes, and  
10 establishments conducting processing at retail. Includes  
11 establishments serving a highly susceptible population or that 4  
12 conduct specialized processes, e.g., smoking and curing;  
13 reduced oxygen packaging for extended shelf-life.

14  
15

1        **B.     Have the Proper Equipment**

2        In order to conduct risk-based inspections, each inspector must be  
3        provided with the proper equipment to assess the control of foodborne  
4        illness risk factors within food establishments. See Program Standard 8 at  
5        <http://www.cfsan.fda.gov/~dms/ret-std8.html> for recommendations of  
6        equipment needed by inspectors. At a minimum, each inspector should  
7        be provided with the following essential equipment:

- 8            •     Thermocouple with the appropriate probes for the food being  
9            tested
- 10          •     Alcohol swabs or other suitable equipment for sanitizing probe  
11          thermometers
- 12          •     Chemical test kits for different chemical sanitizer types
- 13          •     Heat-sensitive tape or maximum registering thermometer
- 14          •     Flashlight
- 15          •     Head cover, such as baseball cap, hair net, or equivalent.

16        Other equipment may be provided to inspectors on an “as needed” basis.  
17        While it is desirable for each inspector to have the following equipment,  
18        depending on the resources available to the agency, this equipment may  
19        be shared in a central office as appropriate:

- 20          •     Pressure gauge for determining in-line pressure of hot water at  
21          injection point of warewashing machine (15-25 psi)
- 22          •     Light meter
- 23          •     Measuring device for measuring distances
- 24          •     Time/temperature data logger
- 25          •     pH meter
- 26          •     Water activity meter
- 27          •     Camera
- 28          •     Computers with or without an electronic inspection system
- 29          •     Black light
- 30          •     Foodborne illness investigation kits

- Sample collection kits
- Cell phones.

### **C. Provide Adequate Training**

Standard 2 of the Program Standards explains that regulatory staff shall have the knowledge, skills, and ability to adequately perform their required duties. Inspectors need the proper training before they can be expected to conduct risk-based inspections. Training includes a combination of classroom training, in-field training, standardization, and continuing education. For specific training recommendations refer to Program Standard 2 at <http://www.cfsan.fda.gov/~dms/ret-std2.html>.

#### **(1) Classroom Training**

The first phase of staff training should provide an orientation to the program with a review of program history, structure, and relationships to other food-related programs. Specific emphasis should be on the program's goals and objective. The basic training curriculum should include the following components:

- Prevailing statutes, regulations, or ordinances
- Public health principles
- Communication skills
- Epidemiology
- Microbiology
- HACCP.

FDA's ORA-U (<http://www.fda.gov/ora/training/>) provides basic curriculum components free of charge to regulators via the internet. This allows state, local, and tribal health departments to conserve their time and funding resources instead of developing their own training courses. It also allows inspectors to access training as needed. Distance learning allows government agencies and industries to cost-effectively disseminate the most current technical and regulatory information on an as-needed basis.

#### **(2) Field Training and Experience**

1 The second phase of training should move the new inspector into the field  
2 with a training officer. On-site training should focus on specific inspection  
3 tasks such as interviewing, making observations, measuring conditions such  
4 as temperatures and sanitizer strength, assessing the control operators  
5 have over the foodborne illness risk factors, ensuring implementation of  
6 Food Code interventions, and completing the inspection form. If an  
7 electronic database is used by the agency, training in its use should be  
8 included in this phase.

9 The evaluation of food safety management systems based on HACCP principles  
10 should be part of the field training experience. The trainee and the trainer should  
11 review establishment menus, operations, recipes, and standard operating  
12 procedures. Inspectors should be able to demonstrate proficiency in  
13 gathering information about the food preparation processes, including  
14 accurate charting of the food flows and determination of the Critical Control  
15 Points (CCPs) and critical limits in an operation. This part of the training  
16 should also include a familiarization with the compliance and enforcement  
17 protocol in place in the jurisdiction including recommendation of voluntary  
18 strategies to prevent risk factor occurrence.

### 19 **(3) Standardization**

20 The third part of staff training should include standardization. This process  
21 improves uniformity in the application and interpretation of applicable  
22 regulations, inspection methodology, and report writing. The Program  
23 Standards recommend that staff conducting inspections undergo a  
24 standardization process similar to the one described in the *FDA*  
25 *Procedures for Standardization and Certification of Retail Food Inspection/  
26 Training Officers* (<http://www.cfsan.fda.gov/~ear/rfi-toc.html>). Standardization  
27 should be completed after the trainee completes classroom and field training.

### 28 **(4) Continuing Education**

29 The training process for inspection staff should be continuous. The final phase  
30 of training should include a mechanism to ensure that learning is ongoing  
31 and staff is kept abreast of food safety issues and the latest science.

1           **D.     Ensure Adequate Program Resources**

2           As indicated in Standard 8 of the Program Standards, regulatory agencies  
3           should have adequate funding, staff, and equipment necessary to support  
4           a risk-based retail food safety program designed to reduce the occurrence  
5           of foodborne illness risk factors. Program management should do  
6           everything they can to secure funding and resources to support regulatory  
7           food programs.

8           Standard 8 of the Program Standards also states that the program budget  
9           should provide the necessary resources to develop and maintain a retail  
10          food safety program that has a staffing level of one full-time equivalent  
11          (FTE) devoted to food for every 280 - 320 inspections performed.  
12          Inspections, for purposes of this calculation, include routine inspections, re-  
13          inspections, complaint investigations, outbreak investigations, compliance  
14          follow-up inspections, risk assessment reviews, process reviews, variance  
15          process reviews, and other direct establishment contact time such as on-  
16          site training.

17  
18           **4.     RISK-BASED INSPECTION METHODOLOGY**

19           **A.     Focus the Inspection**

20          Conducting a risk-based inspection requires inspectors to focus their efforts  
21          on evaluating the degree of active managerial control that operators have  
22          over foodborne illness risk factors. In addition, it is essential that the  
23          implementation of Food Code interventions also be verified during each  
24          inspection. Inspectors need to spend the majority of their time observing  
25          the behaviors, practices, and procedures that are likely to lead to out-of-  
26          control foodborne illness risk factors and asking management and food  
27          employees questions to supplement actual observations.

28          Retail and food service operators implement “control measures” to ensure  
29          food safety. Control measures are actions or activities that are used to  
30          prevent, eliminate, or reduce food safety hazards. Inspectors need to  
31          determine the control measures that should be implemented to prevent the

1 occurrence of foodborne illness risk factors in each food preparation  
2 process. In order to determine the foodborne illness risk factors common  
3 to each operation, it is important for inspectors to understand that the  
4 food preparation processes and all the associated control measures  
5 initiated by a retail or food service operator represent a food safety  
6 management system. It will be necessary for inspectors to ask questions  
7 in order to gain information about the system already in place. Once the  
8 degree of active managerial control is determined, inspectors will be able  
9 to assist operators with strengthening their existing food safety  
10 management systems.

### 11 **B. Lead by Example**

12 Nonverbal communication is just as important as verbal communication in  
13 relaying important food safety principles to retail and food service  
14 operators. By setting the example during inspections, inspectors not only  
15 demonstrate competency, but they also relay important food safety  
16 information to the person in charge and food employees. The following  
17 are ways that inspectors set the example during inspections:

- 18 • Washing their hands when entering the food preparation area  
19 at the beginning of the inspection and after engaging in any  
20 activities that might contaminate their hands
- 21 • Not working when they are suffering from symptoms such as  
22 diarrhea, fever, vomiting, or jaundice or if they are diagnosed  
23 with a disease transmittable by food
- 24 • Being careful not to touch ready-to-eat (RTE) food with their  
25 bare hands
- 26 • Washing and sanitizing their thermocouple probe at the start  
27 of the inspection and between foods
- 28 • Using a proper hair restraint and practicing good personal  
29 hygiene

- Being careful not to contaminate clean and sanitized food contact-surfaces with unclean hands or their inspection equipment.

**C. Conduct Inspections at Variable Times**

Inspectors should enter the food establishment during hours of operation or at other reasonable times. Inspectors should show identification and provide the permit holder or person in charge with a verbal or written notice of the purpose of the inspection. Procedures outlined in the Food Code and in the jurisdiction’s procedures should be followed if access to conduct an inspection is denied. Refusal should be documented on the inspection report and an administrative or judicial inspection order obtained.

In planning for inspections, inspectors should consider the importance of timing. Several operational steps at retail such as receiving, preparation, and cooling can be evaluated only during limited time periods. In order to properly evaluate critical processes that occur outside of the normal 8 a.m. to 5 p.m. working hours, an inspector should be allowed the flexibility to conduct inspections early in the morning, late in the evening, and even on weekends.

**D. Establish Inspection Priorities and Use Inspection Time Wisely**

With the limited time allotted for inspections, inspectors must develop clear priorities to make the most efficient use of their time in each food establishment. Although basic sanitation issues generally do not change during the course of an inspection, critical behaviors, practices, and procedures leading to foodborne illness risk factors may be only observable during limited time periods of the preparation or cooling process. For this reason, assessment of the active managerial control of foodborne illness risk factors should generally be performed before reviewing basic sanitation issues.

To effectively set priorities, the following four activities should be completed early in the inspection:

- (1) Establish an open dialogue with the person in charge
- (2) Review previous inspection records

1 (3) Conduct a menu or food list review

2 (4) Conduct a quick walk-through.

3  
4 **(1) Establish an Open Dialogue with the Person in Charge**

5 The tone of the inspection is often set during the first few minutes of the  
6 inspection. A professional but personable approach is the balance which  
7 should be maintained. Genuine interest in the food establishment and the  
8 staff translates into good relations which may be helpful in conveying the  
9 goal of promoting public health. Having an open dialogue with the person  
10 in charge during all phases of the inspection gives inspectors an  
11 opportunity to learn important information about the existing food safety  
12 management system.

13 It is important to know both the strengths and weaknesses of the existing  
14 food safety management system early in the inspection in order to focus  
15 the inspection on weak areas. Questions about practices and procedures  
16 related to foodborne illness risk factors and Food Code interventions such  
17 as the establishment's employee health policy and consumer advisory  
18 notice should be asked during all phases of the inspection. It is  
19 important to ask enough questions to fully understand the system being  
20 utilized in the food establishment. This is especially true when evaluating  
21 whether the employees are adhering to the established no bare hand  
22 contact and handwashing policies. Asking the person in charge questions  
23 about important activities such as receiving, cooling, and preparation is  
24 also important in relaying the importance of out-of-control foodborne illness  
25 risk factors.

26 The person in charge should be encouraged to accompany inspectors during the  
27 inspection. This may ultimately save time since violations can be pointed  
28 out and corrected as they are observed. In addition, the importance of  
29 violations related to foodborne illness risk factors and Food Code  
30 interventions is more apparent if they are pointed out during the inspection  
31 rather than waiting until the end. Violations should be marked on the

1 inspection form even if immediate corrective actions are taken. Corrective  
2 actions taken should also be recorded on the inspection form. Inspectors can  
3 also use this time to share knowledge about critical processes. By  
4 communicating the public health rationale behind the regulations, inspectors  
5 will leave the person in charge with a clear understanding for why active  
6 managerial control of foodborne illness risk factors must be a top priority  
7 in the day-to-day operation of the business.

8 Early in the inspection, inspectors should inquire about activities that are  
9 presently occurring. Processes that occur over time like cooling and  
10 reheating also need to be assessed over time; thus, inspectors should ask  
11 in the beginning of the inspection if any foods are currently being cooled  
12 or reheated.

13 It is important for inspectors to allow the operator a chance to discuss  
14 issues related to food safety. One-way communication in which inspectors  
15 do all the talking is not conducive to a risk-based philosophy. An  
16 effective risk-based inspection is dependent on inspectors' ability to  
17 maintain two-way communication in order to properly assess behaviors,  
18 processes, and procedures that occur in the food establishment.

## 19 **(2) Review Previous Inspection Reports**

20 In order to detect trends of out-of-control foodborne illness risk factors, it is  
21 important for inspectors to review past inspection reports before conducting  
22 an inspection. This can be done in the office or on-site in the food  
23 establishment. This activity is especially important in jurisdictions where  
24 inspectors rotate from one inspection to the next. If the same foodborne  
25 illness risk factor is out-of-control during more than one inspection, it is  
26 strongly recommended that the operator develop an intervention strategy to  
27 prevent its recurrence. Intervention strategies are discussed later in this  
28 Annex.

29 Knowledge of what has been corrected from the last inspection also gives  
30 inspectors an opportunity to provide positive feedback to the operator and

1 allows inspectors to track corrected violations in accordance with their  
2 jurisdiction's policies and procedures.

### 3 **(3) Conduct a Menu / Food List Review**

4 Menus, including all written and verbal lists of foods prepared and offered  
5 in a food establishment, can be reviewed in a fairly simple manner. The  
6 review can either be done simultaneously with a quick walk-through of the  
7 operation or at the beginning of the inspection as a discussion with  
8 management. The menu/food list also does not need to be reviewed  
9 during every inspection. If a review was done during a recent inspection,  
10 inspectors should inquire about new items, seasonal items, substitutions, or  
11 changes in preparation since the last menu review was conducted.

12 A review of the menu/food list allows inspectors to begin to group food  
13 items into one of three broad process categories (discussed in Annex 2 of  
14 the Guam Food Code and later in this Annex). Mentally grouping  
15 products by process assists inspectors in focusing the inspection on the  
16 control measures critical to each process. Conducting a review of the  
17 menu/food list also allows inspectors to establish inspection priorities by  
18 identifying:

- 19 • High-risk foods or high-risk food preparation processes
- 20 • Operational steps requiring further inquiry such as receiving,  
21 preparation, cooking, and cooling.

22 By identifying high-risk foods or high-risk food preparation processes,  
23 inspectors can focus the inspection on those foods or processes that are  
24 more likely to cause foodborne illness if uncontrolled. The menu/food list  
25 review might be the only time inspectors are made aware of specialized  
26 processes such as formulating a food so that it is not potentially  
27 hazardous (time/temperature control for safety) food or high-risk seasonal  
28 menu items such as "raw oysters on the half shell." Foods such as  
29 shellstock and certain fish for raw consumption require documentation that  
30 should be reviewed during the inspection. If Caesar salad or hollandaise  
31 sauce is served, further inquiry is needed regarding the preparation of

1 these items since they are sometimes prepared with raw or undercooked  
2 eggs.

3 Several operational steps like receiving, preparation, cooking, and cooling  
4 may not be inspected as vigorously in retail and food service inspections  
5 due, in part, to the hours of the day in which these steps occur. If a  
6 food establishment is inspected in the afternoon hours, for example,  
7 receiving and food preparation might have already occurred. In order to  
8 evaluate the establishment's active managerial control of foodborne illness  
9 risk factors, it is imperative that inspectors ask enough questions to obtain  
10 information about the operational steps that they cannot directly observe  
11 during the current inspection.

#### 12 **(4) Conduct a Quick Walk-through**

13 As inspectors discuss the menu or food list and establishes open  
14 communication with the person in charge, it is suggested that they  
15 conduct a quick walk-through of the food establishment to observe what is  
16 going on at that time. Conducting a quick walk-through is especially  
17 important to observe several activities that might otherwise go unnoticed or  
18 unobserved until later in the inspection, including:

- 19 • Receiving
- 20 • Food preparation and handling
- 21 • Cooking
- 22 • Cooling
- 23 • Reheating.

24 Speaking directly to the food service employees preparing the food is also  
25 an excellent way to assess the effectiveness of the establishment's food  
26 safety training and standard operating procedures for critical processes  
27 such as cooling. Noting that receiving or food preparation is occurring at  
28 the beginning of the inspection allows inspectors an opportunity to take  
29 advantage of viewing "real-life" production processes and will help  
30 inspectors to obtain a clear picture of the establishment's true practices.  
31 Receiving and food preparation only occur during limited times, so

1 inspectors may want to stop and observe these operational steps while  
2 they are happening.

3 Early in the inspection, temperatures of potentially hazardous foods  
4 (time/temperature control for safety (TCS) foods) should be taken. For  
5 example, if inspecting in the morning, inspectors should check the  
6 temperatures of last night's stored leftovers. If inspecting in the afternoon,  
7 inspectors should check the temperatures of foods prepared that morning  
8 that are now cooling. Also, inspectors should ask whether any foods are  
9 currently being cooked or reheated.

#### 10 **E. Determine Process Flows**

11 Many retail and food service establishments have implemented effective  
12 food safety management systems by establishing controls for the food  
13 preparation methods and processes common to their operation. Control of  
14 food preparation processes rather than individual food items is often called  
15 the "process approach" to HACCP. The process approach using the  
16 principles of HACCP can best be described as dividing the many food  
17 items in an operation into food preparation processes then analyzing the  
18 foodborne illness risk factors associated with each process. By placing  
19 managerial controls on specific operational steps in the flow of food,  
20 foodborne illness can be prevented.

21 As presented in Annex 2 of the Guam Food Code, most food items  
22 produced in a retail or food service establishment can be categorized into  
23 one of three preparation processes based on the number of times the food  
24 passes through the temperature danger zone between 41°F and 135°F.  
25 In conducting risk-based inspections, it is necessary for an inspector to be  
26 knowledgeable regarding how food is prepared in the operation. Knowing  
27 how products are prepared in an establishment allows inspectors to focus  
28 their inspections on the critical procedures and steps in the preparation of  
29 those products.

#### 30 **F. Determine Foodborne Illness Risk Factors In Process Flows**

1 Annex 2 of the Guam Food Code details the essential control measures  
2 specific to each food preparation process, in addition to essential facility-  
3 wide control measures. Inspectors should generally focus their inspections  
4 on verifying that operators have implemented control measures to control  
5 for foodborne illness risk factors common to the processes conducted in  
6 each operation. There may be other foodborne illness risk factors unique  
7 to specific operations; thus, inspectors should independently evaluate each  
8 operation and food preparation process conducted.

9 **G. Assess Active Managerial Control of Foodborne Illness Risk**  
10 **Factors and Implementation of Food Code Interventions**

11 Although some food establishments have formal HACCP plans, many do  
12 not. Even without a HACCP system, every food establishment needs to  
13 have active managerial control of foodborne illness risk factors. This may  
14 be achieved through several means, such as training programs, manager  
15 oversight, or standard operating procedures. For example, some food  
16 establishments incorporate control measures into individual recipes,  
17 production schedules, or employee job descriptions to achieve active  
18 managerial control.

19 While a person in charge may require the maintenance of in-house written  
20 records by employees to ensure that monitoring is being performed using  
21 the correct method and at the proper frequency, foodborne illness risk  
22 factors may be managed without the use of formal record keeping.  
23 Monitoring, whether through direct observations or by taking appropriate  
24 measurements, is by far the most important step in ensuring food safety.  
25 If an operator is effectively monitoring all critical activities in the food  
26 establishment and taking corrective actions when needed, safe food will  
27 result. With a few exceptions, maintaining formal records at retail is not  
28 required; therefore, records may not be in place for use during the  
29 inspection. As a result, it will be necessary to use direct observations and  
30 interviewing to determine whether a food establishment is adequately

1 monitoring foodborne illness risk factors in their existing food safety  
2 management system.

3 This section provides a comprehensive discussion of how to assess the  
4 active managerial control of each of the foodborne illness risk factors and  
5 the implementation of each of the Food Code interventions. Assessment  
6 of active managerial control involves more than determining compliance  
7 with Food Code provisions. In assessing whether the operator has active  
8 managerial control, inspectors should observe whether the operator has  
9 established the appropriate control measures and critical limits and whether  
10 appropriate monitoring and corrective action procedures are in place and  
11 followed. In addition, inspectors should assess whether managers and  
12 employees are knowledgeable of food safety principles and critical  
13 practices and procedures necessary to prevent foodborne illness. If during  
14 the inspection inspectors observes that control measures are not being  
15 implemented appropriately to control risk factor occurrence, immediate  
16 corrective action must be taken.

#### 17 **(1) Demonstration of Knowledge**

18 It is the responsibility of the person in charge to ensure compliance with  
19 the Code. Knowledge and application of Food Code provisions are vital to  
20 preventing foodborne illness and injury. Data collected by FDA suggest  
21 that having a certified food manager on-site has a positive effect on the  
22 occurrence of certain foodborne illness risk factors in the industry.

23 In order to assess whether the person in charge demonstrates knowledge,  
24 inspectors should verify that the person in charge has one or more of the  
25 following:

- 26 • A valid food protection manager certificate
- 27 • No critical violations during the current inspection
- 28 • Correct responses to food safety related questions as  
29 presented in ¶ 2-102.11(C) of the Guam Food Code.

#### 30 **(2) Assessing Safe Sources and Receiving Temperatures**

1 The time and day of the inspection is important when assessing whether  
2 foods are received from safe sources and in sound condition. Foods may  
3 be received in the food establishment on set days. Inspectors should ask  
4 questions to ascertain the day or days that deliveries are received and  
5 also the receiving procedures in place by the food establishment.  
6 Inspections can be scheduled at times when it is known that products will  
7 be received by the food establishment. If food is being delivered during  
8 the inspection, inspectors should:

- 9 • Verify internal product temperatures
- 10 • Examine package integrity upon delivery
- 11 • Look for signs of temperature abuse (e.g., large ice crystals  
12 in the packages of frozen products)
- 13 • Examine delivery truck and products for potential for cross-  
14 contamination
- 15 • Observe the food establishment's behaviors and practices as  
16 they relate to the establishment's control of contamination and  
17 holding and cooling temperatures of received products
- 18 • Review receiving logs and other documents, product labels,  
19 and food products to ensure that foods are received from  
20 regulated food processing plants (no foods prepared at home)  
21 and at the proper temperature.

22 When evaluating approved sources for shellfish, such as clams, oysters,  
23 and mussels, inspectors should ask whether shellfish are served at any  
24 time during the year. If so, inspectors should review the tags or labels to  
25 verify that the supplier of the shellfish is certified and on the most current  
26 Interstate Certified Shellfish Shippers List  
27 (<http://www.cfsan.fda.gov/~ear/shellfis.html>). Inspectors should note whether  
28 all required information is provided on the tags or label (harvester's  
29 certification number, harvest waters and date, type and quantity of shellfish  
30 and similar information for each dealer that handles the shellfish after the

1 harvester). Shellstock tags should also be retained for 90 days in  
2 chronological order.

3 With regard to fish, inspectors should verify that fish are commercially  
4 caught and harvested and received from reputable vendors. If fish are  
5 being delivered during the inspection or if they were received just before  
6 inspectors' arrival, temperatures should be taken, especially if there are  
7 finfish such as tuna, mahi-mahi, bluefish, mackerel, and snapper. These  
8 fish are subject to scombrototoxin formation if time/temperature abused.  
9 Inspectors should verify freshness by conducting an organoleptic inspection  
10 of the gills, eyes, and bodies of the fish.

11 Inspector should verify that fish, except for certain species of tuna,  
12 intended for raw or undercooked consumption have been frozen for the  
13 required time and temperature parameters to destroy parasites by either  
14 reviewing freezing records or verifying that a letter of guarantee from the  
15 purveyor is kept on file. If freezing is conducted on-site, inspectors should  
16 verify that the freezing records are maintained for at least 90 days beyond  
17 the date of sale or service.

18 With regard to the service of game or wild mushrooms, inspectors should  
19 ask if these products are served at any time during the year. If so,  
20 inspectors should verify that they are from an approved source by  
21 reviewing invoices.

22 With regard to juice and milk products, inspectors should verify that fluid  
23 milk and milk products are pasteurized and received at the proper  
24 temperature. For packaged juice, inspectors should verify that the juice  
25 was pasteurized or otherwise treated to achieve a 5-log reduction of the  
26 most resistant microorganism.

27 During the inspection, inspectors should inquire as to the source of foods  
28 that have been removed from their original containers. If at any time  
29 during the inspection there is any doubt as to the source of certain  
30 products, inspectors should ask for invoices or receipts to demonstrate  
31 their source. Certain products, such as flat breads, waffles, pies, and

1 cakes may require special cooking equipment to prepare. If suitable  
2 equipment is not on-site to prepare such products and the products are  
3 not stored in original containers, then inspectors should inquire as to the  
4 source of these products.

5 Food from unapproved, unsafe, or otherwise unverifiable sources should be  
6 discarded or put on hold or under embargo until appropriate  
7 documentation is provided. In addition, inspectors should ensure that  
8 management and employees are aware of the risk of serving or selling  
9 food from unapproved sources. Fish that are intended to be consumed  
10 raw or undercooked and for which no freezing certification or equipment is  
11 found on-site, can be used in menu items that will be fully cooked. If  
12 cooking is not an option due to the menu items served, the fish should be  
13 discarded.

### 14 **(3) Assessing Contaminated Equipment and Potential for** 15 **Cross-Contamination**

16 This risk factor involves the proper storage and use of food products and  
17 equipment to prevent cross-contamination. The cleaning, sanitization, and  
18 storage of food-contact surfaces of equipment and utensils in a manner to  
19 prevent transmission of foodborne pathogens or contamination is also  
20 included in this risk factor.

21 As inspectors walk through the food establishment, they should examine  
22 food storage areas for proper storage, separation, segregation, and  
23 protection from contamination. Inspectors should look to see that raw  
24 animal foods and ready-to-eat foods are separated during receiving,  
25 storage, and preparation. For example, cooked shrimp should not be  
26 returned to the same container that previously held uncooked product.  
27 Cutting boards should be washed, rinsed, and sanitized between trimming  
28 uncooked chicken and cooked steak.

29 In addition, raw animal foods should be separated by cooking  
30 temperatures such that foods requiring a higher cooking temperature, like  
31 chicken, should be stored below or away from foods requiring a lower

1 temperature, like pork and beef. If potentially hazardous foods (TCS  
2 foods) are not being cooled, they should be covered or packaged while in  
3 cold storage.

4 Following the flow of food as it is prepared in the food establishment may  
5 alert inspectors to opportunities for cross-contamination. When  
6 contamination has occurred between raw and ready-to-eat food, inspectors  
7 should assess whether the food can be reconditioned. In some cases,  
8 depending on the affected food, it may be possible to reheat the food to  
9 eliminate any hazards. If the food cannot be reconditioned, then the food  
10 should be discarded.

11 Inspectors should verify that exposed food such as chips, bread, and  
12 dipping sauces are not re-served to the consumer. Consumer self-service  
13 operations are addressed in the Code with regard to the types of food  
14 offered for consumer self-service, the protection of food on display, and  
15 the required monitoring by employees of such operations.

16 A visual check of the food-contact surfaces of equipment and utensils  
17 should be made to verify that the utensils are maintained clean and  
18 sanitized using the approved manner and frequency. Utensils that are  
19 observed to have debris, grease, or other visible contamination should be  
20 rewashed and re-sanitized.

21 Observations should be made to determine whether practices are in place  
22 to eliminate the potential for contamination of utensils, equipment, and  
23 single-service items by environmental contaminants, employees, and  
24 consumers. When clean equipment and utensils are stored where they are  
25 subject to environmental contamination such as near handwashing sinks or  
26 prep sinks, inspectors should have the operator rearrange the equipment  
27 in a manner to prevent cross-contamination. Depending on the  
28 circumstances, the operator may need to rewash and re-sanitize the  
29 equipment.

30 Inspectors should observe handwashing operations. If handwashing sinks  
31 and fixtures are located where splash may contaminate food contact

1 surfaces or food, then splash guards should be installed or food-contact  
2 surfaces should be relocated to prevent cross-contamination.

3 Inspectors should pay particular attention to prep sinks, especially those  
4 that are currently in use at the time of the inspection. Built-up grime is a  
5 visible sign that the sink is not being washed, rinsed, and sanitized  
6 appropriately before use. If there are designated vegetable or meat sinks,  
7 inspectors should verify that the placement of sinks and food preparation  
8 areas do not facilitate opportunities for cross-contamination from one to the  
9 other.

10 With regard to the cleaning and sanitization of food-contact surfaces,  
11 inspectors should verify the compliance of any warewashing operations by  
12 ensuring that cleaning and sanitizing procedures for all food-contact  
13 surfaces conform to the requirements in the Food Code. Questions should  
14 be asked to assess how utensils and cookware are washed, rinsed, and  
15 sanitized in the food establishment. When assessing the warewashing  
16 procedure and equipment, inspectors should pay particular attention to  
17 cooking and baking equipment that is too large to fit in the dishmachine  
18 or sinks. It is a good idea to have the person responsible for dishwashing  
19 demonstrate the procedure that is followed in the food establishment by  
20 setting up the sinks and watching the dishwashing procedure.

#### 21 **(4) Assessing Cooking Temperatures**

22 Food cooking temperatures and times should be verified by inspectors  
23 during each inspection. Every effort should be made to assess the  
24 cooking temperatures of a variety of products served in the food  
25 establishment.

26 To assess cooking, inspections must occur at times when food is being  
27 cooked. It is also important to conduct inspections during busy times,  
28 such as lunch and dinner, as there may be a tendency for the operator  
29 to rush the cooking of foods during these times.

30 Critical limits for cooking potentially hazardous foods (TCS foods) in the  
31 Food Code include specifications that all parts of the food be heated to a

1 certain temperature. For large roasts, temperature measurement should take  
2 into account post-cooking heat rise which allows the temperature to reach  
3 equilibrium throughout the food. The critical limit of time at the terminal  
4 temperature must also be measured during inspections. For example, a  
5 roast beef cooked at 54°C (130°F) is required to be held at this  
6 temperature for 112 minutes to ensure destruction of pathogens. Cooking  
7 times and temperatures should be noted on the inspection report.

8 The correct temperature measuring device and technique are essential in  
9 accurately determining the temperatures of potentially hazardous foods (TCS  
10 foods). The geometric center or thickest part of a product is the points of  
11 measurement of product temperature particularly when measuring critical  
12 limits for cooking.

13 Inspectors should take internal temperatures of products using a  
14 thermocouple or thermistor with a probe suitable for the product thickness.  
15 A thin diameter probe should be used for temperature measurements of  
16 hamburger patties and fish filets. Alternately, although less desirable, an  
17 inspector may use a suitable, calibrated bimetal stem thermometer for  
18 checking cooking temperatures of thick foods. Infrared thermometers are  
19 inappropriate for measuring internal cooking temperatures.

20 In order to better assess cooking during all phases of the inspection,  
21 inspectors could enlist the help of cooperative food employees to notify  
22 them of foods that have finished cooking. This allows inspectors to  
23 continue with the inspection in other areas of the operation yet continue  
24 to verify that proper cooking temperatures are being met.

25 Food establishments should routinely monitor cooking temperatures.  
26 Inspections should verify that monitoring is occurring by involving the  
27 person in charge in these activities during the regulatory inspection. The  
28 presence of required thermometers and their proper use should be  
29 assessed.

30 Comparisons should be made between inspectors' calibrated temperature  
31 measuring device and those used by the food establishment. Notation of

1 deviations should be made on the inspection report. Inspectors should ask  
2 food establishment personnel to demonstrate proper calibration of their  
3 temperature measuring devices.

4 If required cooking temperatures are not met, inspectors should have the  
5 operator continue cooking the food until the proper temperature is reached.  
6 Additionally, inspectors should explain the public health significance of  
7 inadequate cooking to management and food employees.

#### 8 **(5) Assessing Holding Time and Temperatures and Date** 9 **Marking**

10 Hot and cold holding temperatures, as well as cooling time and  
11 temperatures, of potentially hazardous foods (TCS foods) should be  
12 thoroughly checked with a thermocouple, thermistor, or other appropriate  
13 temperature measuring device during each inspection. This includes the  
14 temperature of potentially hazardous food (TCS food) during transport, e.g.,  
15 hot holding carts being used to transport food to patient rooms in a  
16 hospital, satellite kitchens, or off-site catering events. As a rule, every  
17 effort should be made to assess every hot and cold holding unit in the  
18 food establishment during a risk-based inspection.

19 Use of an infrared thermometer for verifying holding temperatures is not  
20 consistent with Food Code requirements since verifying only the surface  
21 temperature of the food may not alert inspectors to problems that exist  
22 under the food's surface. Such problems could stem from improper  
23 cooling, in the case of cold-held foods, or improper reheating, in the case  
24 of hot-held foods. In addition, inspectors should not stir a food before  
25 taking its temperature since it is important to know the temperature of the  
26 food before it is agitated.

27 The geometric center of a product is usually the point of measurement of  
28 product temperature particularly when measuring the critical limit for cold  
29 holding.

30 The hot holding critical limit may need additional measurements taken at  
31 points farthest from the heat source, e.g., near the product surface for

1 food held on a steam table. Temperatures monitored between packages  
2 of food, such as cartons of milk or packages of meat, may indicate the  
3 need for further examination. However, the temperature of a potentially  
4 hazardous food (TCS food) itself, rather than the temperature between  
5 packages, is necessary for regulatory citations. In large holding units and on  
6 steam tables, it is necessary to take the temperatures of foods in various  
7 locations to ensure that the equipment is working properly. If deviations  
8 are noted in the product temperatures, it is important to take extra steps  
9 to find out whether the problem is the result of equipment failure or  
10 whether a breakdown in a process such as cooling or reheating is the  
11 reason for the problem.

12 Corrective actions for foods found in violation should be required based on  
13 the jurisdiction's regulatory food code. If foods are to be discarded, forms  
14 such as those used for stop sale or embargo may need to be completed  
15 and signed by the person in charge in accordance with the jurisdiction's  
16 regulatory food code. In order to properly evaluate the degree of time and  
17 temperature abuse and the proper disposition of the affected food, several  
18 issues must be considered. Answers to these questions, in combination  
19 with observations made during the inspection, should provide inspectors  
20 with enough information to make the appropriate recommendation for on-site  
21 correction:

- 22 • Are there any written procedures in place for using time  
23 alone as a public health control and, if so, are they being  
24 followed properly?
- 25 • What are the ingredients of the food and how was it made?
- 26 • Is it likely that the food contains *Clostridium perfringens*,  
27 *Clostridium botulinum*, or *Bacillus cereus* as hazards?
- 28 • Has there been an opportunity for post-cook contamination  
29 with raw animal foods or contaminated equipment?
- 30 • If there has been an opportunity for post-cook contamination,  
31 can the hazards of concern be eliminated by reheating?

- 1 • Are the food employees practicing good personal hygiene  
2 including frequent and effective handwashing?
- 3 • Was the food reheated or cooked to the proper temperature  
4 before being allowed out of temperature control?
- 5 • What is the current temperature of the food when taken with a  
6 probe thermometer?
- 7 • How long has the food been out of temperature control (ask  
8 both the manager and food employees)? Are the answers of  
9 the food employees and the manager consistent with one  
10 another?
- 11 • Is it likely that food has cooled to its current temperature  
12 after being out of temperature control for the alleged time?
- 13 • Will the food be saved as leftovers?
- 14 • How long before the food will be served?
- 15 • Given what is known about the food, the food's temperature,  
16 the handling of the food, and the alleged time out of  
17 temperature, is it reasonably likely that the food already  
18 contains hazards that cannot be destroyed by reheating?

19 Even if food can be reconditioned by reheating, steps should be taken by  
20 the person in charge to ensure compliance in the future. Examples  
21 include repairing malfunctioning or inoperative equipment or implementing a  
22 risk control plan (RCP) to modify preparation procedures or to institute a  
23 procedure for monitoring holding temperatures of food.

24 If using time only or time-temperature combinations in lieu of temperature  
25 for controlling the growth and toxin-formation of pathogenic bacteria, strict  
26 controls must be in place and followed. Inspectors should verify that the  
27 written procedures are on-site and followed in accordance with the Food  
28 Code.

29 Date marking is the mechanism by which active managerial control of  
30 time-temperature combinations can prevent the growth of *Listeria*  
31 *monocytogenes* in potentially hazardous (TCS), ready-to-eat foods during

1 cold storage. With exceptions, all ready-to-eat, potentially hazardous foods  
2 (TCS foods) prepared on-site and held for more than 24 hours should be  
3 date marked to indicate the day or date by which the foods need to be  
4 served or discarded. Inspectors should ask questions to ascertain whether  
5 the system in place to control for *L. monocytogenes* meets the intent of  
6 the Food Code. Food that should be date marked and is not should be  
7 discarded.

#### 8 (6) Assessing Reheating for Hot Holding

9 In order to assess a food establishment's control of reheating for hot  
10 holding, the time of day that the inspection occurs is a key factor. Every  
11 effort should be made to schedule an inspection during pre-opening  
12 preparation. If inspections are conducted during pre-opening preparation or  
13 other preparation periods, inspectors should ask questions regarding the  
14 history of hot-held foods. Foods in compliance for minimum hot holding  
15 temperatures may have in fact been improperly reheated before being  
16 placed into hot holding units or steam tables.

17 If items are found "reheating" on the steam table, further inquiry is needed  
18 to assess whether the equipment in question is capable of reheating the  
19 food to the proper temperature within the maximum time limit. Corrective  
20 action for foods found out of compliance for reheating for hot holding  
21 would depend on how long the food had been out of temperature and other  
22 factors. In most cases, however, the food may be rapidly reheated and hot  
23 held.

#### 24 (7) Assessing Cooling

25 Improper cooling remains a major contributor to bacterial foodborne illness.  
26 Cooling temperatures and times need to be closely evaluated during every  
27 inspection. In order to assess whether a food establishment has control over  
28 cooling, the time of day that the inspection occurs is critical. Early  
29 morning inspections allow an opportunity to verify that leftovers from the  
30 night before were cooled properly or cooled using a proper cooling  
31 method. Alternatively, afternoon inspections may allow an inspector to

1 verify cooling of products that may have been prepared that morning.  
2 Because many food establishments prepare bulk products only on certain  
3 days of the week, it is essential that inspectors become as familiar as  
4 possible with each operation and schedule their inspections accordingly.  
5 Due to the time parameters involved in cooling, inspectors should always  
6 inquire at the beginning of the inspection whether there are any products  
7 currently being cooled. This allows inspectors an opportunity to take initial  
8 temperatures of the products and still have time to re-check temperatures  
9 later in the inspection in order to verify that critical limits are being met.  
10 Problems with cooling can often be discovered through inquiry alone.  
11 Even when no cooling is taking place, inspectors should ask the food  
12 employees and managers questions about the cooling procedures in place.  
13 When examining cold holding units, bulk containers and buckets, tightly  
14 packed pans, shrouded rolling racks, or closed rolling cabinets should  
15 warrant further temperature and time investigation. Bulk containers and  
16 buckets should be opened since they are commonly reused for food  
17 storage and cooling.  
18 The geometric center of a product is often chosen as the point of  
19 measurement of product temperature particularly when measuring the  
20 critical limits for cooling. For foods that are being cooled, temperature  
21 profiles throughout the product may show proper temperatures at outer  
22 edges and hot spots at the core of the product. Inspectors can verify  
23 cooling by first taking a temperature measurement in the geometric center  
24 of the product, then at various points around the perimeter of the product.  
25 Warmer temperatures in the center of the product, in combination with  
26 cooler temperatures around the perimeter, indicate that a product is  
27 cooling. Additional questions should be asked to ascertain the cooling time  
28 parameters of the food in question. Information gained from food  
29 employees and management, in combination with temperature  
30 measurements taken, should form the basis for assessing compliance of  
31 cooling during an inspection.

1 The following guidance may be used for determining the appropriate corrective  
2 action for improper cooling. Cooked hot food may be reheated to 165 °F for  
3 15 seconds and the cooling process started again using a different cooling  
4 method if the food is:

- 5 • Above 70 °F and two hours or less into the cooling process;  
6 and
- 7 • Above 41 °F and six hours or less into the cooling process.

8 Cooked hot food should be discarded immediately if the food is:

- 9 • Above 70 °F and more than two hours into the cooling  
10 process; or
- 11 • Above 41 °F and more than six hours into the cooling  
12 process.

13 A different, more accelerated, cooling method may be used for prepared ready-  
14 to-eat foods if the food is above 41 °F and less than four hours into the cooling  
15 process; however, such foods should be discarded if the food is above 41  
16 °F and more than four hours into the cooling process.

### 17 **(8) Assessing Personal Hygiene, Hands As a Vehicle of** 18 **Contamination, and Proper Implementation of Employee** 19 **Health Policies**

20 Special attention should be given to the potential for hands as a vehicle of  
21 contamination. An effective management system for prevention of hand  
22 contamination involves three elements:

- 23 • Employee health policy
- 24 • Proper handwashing
- 25 • No bare hand contact with ready-to-eat foods.

26 There are a wide range of communicable diseases and infections that can be  
27 transmitted by an infected food employee. Proper management of the risks  
28 associated with ill food employees begins with employing healthy people and  
29 implementing a policy that excludes or restricts ill employees as specified in  
30 Chapter 2 of the Food Code. Employees must be aware of the symptoms,  
31 illnesses, or conditions that must be reported to the person in charge. In

1 addition, the person in charge must be knowledgeable regarding the appropriate  
2 action to take should certain symptoms, illnesses, or conditions be  
3 reported.

4 With regard to the employee health policy, inspectors should ask a series  
5 of open-ended questions to ascertain whether the employee health policy in  
6 place complies with the Food Code. The following are example questions  
7 that may be asked:

- 8 • What kind of policy do you have in place for handling sick  
9 employees?
- 10 • Is there a written policy? (Note: a written policy is not required in  
11 the Food Code, but having a written policy may give an indication of  
12 the formality of the policy being discussed.)
- 13 • Describe how managers and food employees are made  
14 knowledgeable about their duties and responsibilities under the  
15 employee health policy.
- 16 • Are food employees asked if they are experiencing certain  
17 symptoms or illnesses upon conditional offer of employment?  
18 If so, what symptoms or illnesses are food employees asked  
19 about? Is there a written record of this inquiry?
- 20 • What are food employees instructed to do when they are  
21 sick?
- 22 • What conditions or symptoms are reported?
- 23 • What may some indicators be of someone who is working  
24 while ill?
- 25 • When are employees restricted from working with exposed  
26 food or food-contact surfaces? When are they excluded from  
27 working in the food establishment?
- 28 ▪ For employees that are sick and cannot come to work, what  
29 policy is in place for allowing them to return and for notifying  
30 the regulatory authority?

1 Special attention should be given to the potential for hands as a vehicle of  
2 contamination. It must be a top priority during every inspection to ensure that  
3 hands are washed using the proper procedure and at the appropriate times.  
4 Data show that viruses can be tenacious even in the presence of good  
5 handwashing. Inspectors should observe employee use of utensils and gloves  
6 during the preparation and service of ready-to-eat foods and ingredients, such as  
7 salads and sandwiches.

8 If ready-to-eat food is touched with bare hands, inspectors will need to address  
9 several questions in order to make the appropriate on-site correction  
10 recommendation. The answers to the following questions should provide enough  
11 information to determine the likelihood of occurrence of hazards transmitted by  
12 bare hands and should be the basis for making a recommendation for on-site  
13 correction:

- 14 • Does the facility have an employee health policy to identify, restrict,  
15 and exclude ill employees?
- 16 • Did the employees working with the food in question effectively  
17 wash their hands and are handwashing facilities adequate?
- 18 • Is there an approved, alternate procedure to no bare hand contact  
19 in place and was it followed before the bare hand contact?
- 20 • Has there been an opportunity for the employee's hands to become  
21 contaminated?

22 Inspectors should examine the location of handwashing sinks in relation to where  
23 food is being prepared. Many jurisdictions use a basic distance  
24 measurement as a guideline when considering the location and number of  
25 handwashing sinks required in a food establishment during the plan review  
26 process. While this information can be used to assist with the review  
27 process, it should not be used as the sole basis for determining whether  
28 there are an adequate number of handwashing sinks or whether the  
29 handwashing sinks are conveniently located.

30 Special emphasis should be placed on spacing in and around fixed  
31 equipment, the expected staffing, and the flow of food throughout a food

1 establishment. For instance, a kitchen may be 30 feet in length and 12 feet  
2 wide. Although the size of the kitchen may dictate only one handwashing  
3 sink using a basic distance measurement, if a prep table the length of the  
4 line is placed between the line and the handwashing sink, the handwashing  
5 sink may not be conveniently located. Likewise, one handwashing sink located  
6 at the end of cook line is useless to employees working at the other end  
7 if there is limited space for employees to go around one another during busy  
8 periods.

### 9 **(9) Assessing Compliance with Approved Procedures**

10 When conducting certain specialized processes, variances and HACCP plans  
11 are required by the Code. This is because such processes carry a considerable  
12 risk if not conducted under strict controls. For food establishments conducting  
13 specialized processes, each inspection should involve a review of the written  
14 variance, if applicable, and the implementation of the HACCP plan to ensure that  
15 food safety hazards are being consistently controlled.

### 16 **(10) Assessing Special Requirements Related to Highly 17 Susceptible Populations (HSP)**

18 Food establishments that serve highly susceptible populations (HSP) must  
19 adhere to additional requirements as specified under Part 3-8 of the Code. Every  
20 effort should be made to inspect such facilities during preparation, service, or  
21 other applicable times to assess these additional requirements as well as those  
22 in other sections of the Food Code.

23 Because those persons who are very young, elderly, or who live in a facility that  
24 provides custodial care are extremely vulnerable to foodborne illness because of  
25 age or health status, it is important that risk factors be controlled on-site in a  
26 timely manner. Inspections of HSP facilities should be conducted by inspectors  
27 knowledgeable in the control of foodborne illness risk factors who take extra care  
28 to assure that the most vulnerable segment of the population are not at risk.

### 29 **(11) Assessing Labeling, Storage, and Use of Poisonous and 30 Toxic Chemicals**

1 During each inspection, the proper labeling, storage, and use of poisonous and  
2 toxic chemicals should be verified. Containers of poisonous or toxic materials  
3 and personal care items shall bear a legible manufacturer's label. Working  
4 containers used for storing poisonous or toxic materials such as cleaners and  
5 sanitizers taken from bulk supplies should be clearly and individually identified  
6 with the common name of the material. Only chemicals that are necessary to the  
7 operation and maintenance of a food establishment, such as for the cleaning and  
8 sanitizing of equipment and utensils and the control of insects and rodents,  
9 should be in the food establishment. Medicines necessary for the health of  
10 employees may be allowed in a food establishment, but they should be labeled  
11 and stored to prevent contamination of food and food-contact surfaces.

12 Inspectors should verify that solutions containing poisonous and toxic  
13 chemicals, like mop water, are discarded in an appropriate service sink to  
14 prevent contamination of food and food-contact surfaces. In addition,  
15 inspectors should check delivery trucks to verify that food is protected  
16 from chemical contamination during shipment. Any food that has been cross-  
17 contaminated with poisonous or toxic chemicals should be discarded or  
18 rejected immediately.

### 19 **(12) Assessing Compliance with Consumer Advisory**

20 Inspectors should ascertain whether animal foods such as beef, eggs, fish,  
21 lamb, milk, pork, poultry, or shellfish are served or sold raw, undercooked, or  
22 without otherwise being processed to eliminate pathogens, either in ready-to-eat  
23 form or as an ingredient in another ready-to-eat food. Inspectors should review  
24 the menu or food list to verify that a consumer advisory with a disclosure and  
25 reminder is present as specified under § 3-603.11 of the Food Code.

26 In addition to reviewing the menu or food list, inspectors should ask  
27 whether raw or undercooked foods are served or sold routinely or  
28 seasonally. It is useful to know foods that are often served in this manner  
29 such as oysters-on-the half shell, hollandaise sauce, béarnaise sauce, eggnog,  
30 salad dressings, hamburgers to order, or sunny-side-up eggs.

### 31 **H. Evaluating Basic Sanitation and Facilities (Good Retail Practices)**

1 An important part of a risk-based, routine inspection is to review how the food  
2 establishment actively monitors the active managerial control of foodborne illness  
3 risk factors and interventions; however, overall sanitation should not be  
4 overlooked. Systems to control basic operational and sanitation conditions within  
5 a food establishment, referred to as Good Retail Practices (GRPs), are the  
6 foundation of a successful food safety management system. GRPs found to be  
7 out-of-compliance may give rise to conditions that may lead to foodborne illness,  
8 e.g., sewage backing up in the kitchen. Just as monitoring is required by the  
9 food establishment to ensure that foodborne illness risk factors are controlled  
10 and interventions are in place, monitoring of basic sanitation conditions in the  
11 food establishment allows the operator an excellent opportunity to detect  
12 weaknesses and initiate actions for improvement. Basic operational and  
13 sanitation programs must be in place to:

- 14 • Protect products from contamination by biological, chemical, and  
15 physical food safety hazards
- 16 • Control bacterial growth that can result from temperature abuse  
17 during storage
- 18 • Maintain equipment, especially equipment used to maintain product  
19 temperatures.

20 Examples of concerns addressed by the basic operation and sanitation programs  
21 mentioned above include the following:

- 22 • Pest control
- 23 • Food protection (non-critical)
- 24 • Equipment maintenance
- 25 • Water
- 26 • Plumbing
- 27 • Toilet facilities
- 28 • Sewage
- 29 • Garbage and refuse disposal
- 30 • Physical facilities.

1           **5.     ACHIEVING ON-SITE AND LONG-TERM COMPLIANCE**

2           **A.     Developing an Effective Compliance and Enforcement     Protocol**

3           Compliance and enforcement are essential elements of a regulatory program and  
4           encompass all voluntary and regulatory enforcement actions taken to achieve  
5           compliance with regulations. Standards 3 and 6 of the Program Standards  
6           explain the need of regulatory jurisdictions to establish a compliance and  
7           enforcement protocol that results in credible follow-up for each violation noted  
8           during an inspection, especially violations related to foodborne illness risk factors  
9           and Food Code interventions. Lack of follow-up on the part of the regulatory  
10          agency signals to the operator that the critical violations noted were not  
11          important.

12          The resolution of out-of-compliance foodborne illness risk factors and Food Code  
13          interventions must be documented in each food establishment record. The  
14          desired outcome of Standard 6 is an effective compliance and enforcement  
15          program that is implemented consistently to achieve compliance with regulatory  
16          requirements.

17          Compliance and enforcement options may vary depending on state and local  
18          law. It is essential that regulatory jurisdictions develop a written compliance and  
19          enforcement protocol that details the order in which both voluntary corrections  
20          may be taken on the part of the operator and involuntary enforcement actions are  
21          to be taken on the part of the regulatory authority. Involuntary enforcement  
22          actions include, but are not limited to, such activities as warning letters, re-  
23          inspections, citations, administrative fines, permit suspensions, and hearings.

24          Food establishment with a history of noncompliance at a level predetermined by  
25          the jurisdiction or with the number of foodborne illness risk factors and  
26          interventions violated warranting a regulatory action, signals the need either a  
27          strong regulatory response or an alternate approach to compliance to protect  
28          public health, e.g., active managerial control, behavioral change.

29          Voluntary corrections taken on the part of the operator include, but are not limited  
30          to, such activities as on-site corrections at the time of inspection, voluntary  
31          destruction, risk control plans, and remedial training. Obtaining voluntary

1 corrections by the operator can be very effective in achieving long-term  
2 compliance. Voluntary corrections by the operator are referred to in FDA's  
3 Regulator's Manual as "intervention strategies." Intervention strategies can be  
4 divided into two groups:

- 5 • Those designed to achieve immediate on-site correction
- 6 • Those designed to achieve long-term compliance.

7 Successful intervention strategies for out-of-control foodborne illness risk factors  
8 can be tailored to each operation's resources and needs. This will require  
9 inspectors to work with the operator to identify weaknesses in the existing food  
10 safety management system and consulting with the operator to strengthen any  
11 weak areas noted.

## 12 **B. On-site Correction**

13 On-site corrections are intended to achieve immediate corrective action of  
14 out-of-control foodborne illness risk factors posing an immediate, serious  
15 danger to the consumer during the inspection. Usually these violations are  
16 "operational" rather than structural and can be addressed by management  
17 at the time of the inspection.

18 **It is essential to consumer protection and to regulatory credibility for on-**  
19 **site correction to be obtained for any out-of-control foodborne illness risk**  
20 **factors before completing the inspection and leaving the food**  
21 **establishment.** Obtaining on-site correction conveys the seriousness of the  
22 violation to management. Failure to require on-site correction when an out-of-  
23 control risk factor has been identified implies that the risk factor has little  
24 importance to food safety.

25 When recommending on-site correction, effective communication regarding out-  
26 of-control foodborne illness risk factors is essential and can be accomplished  
27 best by:

- 28 • Discussing food safety concerns in words that can be easily  
29 understood by the person in charge and employees
- 30 • Conveying the seriousness of the out-of-control foodborne illness  
31 risk factors in terms of increased risk of illness or injury.

1 During the discussion of inspection findings with the person in charge, inspectors  
2 should keep the discussion focused on correction of violations that present an  
3 immediate danger to the consumer. Discussion of less serious code violations  
4 should be deferred until out-of-control foodborne illness risk factors are  
5 discussed and on-site correction is obtained.

6 In most cases, selecting the most appropriate on-site correction when out-of-  
7 control foodborne illness risk factors are observed will be straightforward;  
8 however, in instances such as improper cooling, the appropriate corrective action  
9 may be more complicated. Since determining on-site correction depends on a  
10 number of factors, an inspector may need to conduct a hazard analysis of the  
11 food in order to determine the appropriate course of action to take.

### 12 **C. Intervention Strategies for Achieving Long-term Compliance**

13 While on-site correction of out-of-control foodborne illness risk factors is essential  
14 to consumer protection, achieving long-term compliance and behavior change is  
15 equally important. Overcoming several misconceptions about long-term  
16 compliance will help in achieving a desirable change of behavior. For example,  
17 in jurisdictions using a 44-item inspection report in which only observed  
18 violations are marked, it is often taken for granted that if there are no  
19 violations marked, the foodborne illness risk factors are being controlled.  
20 This is not necessarily true since the observation of code violations is  
21 subject to many variables such as the time of day, day of the week, or  
22 duration of the inspection. An inspection system that records only observed  
23 violations rather than the actual status of all foodborne illness risk factors,  
24 such as whether the risk factor was in compliance, not observed, or not  
25 applicable to the operation, may be unable to detect some foodborne  
26 illness risk factors that are continually or cyclically out of control.

27 Another misconception is that training alone will result in foodborne illness risk  
28 factors being controlled. While training may help, there is no guarantee that  
29 knowledge acquired will equate to knowledge applied in the workplace. In  
30 order for knowledge to translate into changed behavior, it must be  
31 reinforced and the behavior must be repeated for a period of time

1 sufficient for the behavior to become an ingrained pattern. Another  
2 assumption is that regulatory enforcement actions such as citations or  
3 administrative hearings or on-site corrections alone will automatically result in  
4 future management control. Unfortunately, there is no assurance that any of  
5 these actions will result in the long-term control of foodborne illness risk  
6 factors.

7 Long-term compliance may best be achieved through voluntary actions by  
8 the operator. If an operator supports the concept that a food safety  
9 management system is needed, there is a better chance that long-term  
10 compliance will be achieved. The following are ways operators can better  
11 ensure long-term active managerial control of foodborne illness risk factors.

### 12 **(1) Change Equipment and Layout**

13 Critical limits are difficult to achieve when equipment does not work properly.  
14 Proper calibration of equipment is vital to achieving food safety. When  
15 calibration is unsuccessful or is not feasible, equipment should be  
16 replaced. In addition to equipment malfunctioning, poor equipment layout can  
17 present opportunities for cross contamination and must be considered. For  
18 example:

- 19 • Hamburgers with uniform thickness and weight are not all  
20 reaching a safe cooking temperature in a given time. Upon  
21 examination, it is determined that the grill is distributing heat  
22 unevenly. A new element is installed to correct the problem.
- 23 • Splash from a nearby handwashing sink is seen on a prep table. A  
24 splash guard is installed to prevent cross contamination from the  
25 handwashing sink to the prep table.

### 26 **(2) Establish Buyer Specifications**

27 Written specifications for the goods and services purchased by a food  
28 establishment prevent many problems. For example:

- 29 • Fish posing a parasite hazard and intended for raw consumption  
30 have not been frozen for the specified time and temperature  
31 and no freezing equipment is on-site at the food establishment.

1 Buyer specifications are established to place the responsibility for  
2 freezing the fish on the supplier.

- 3 • Lobster tails, hamburgers, or other products cooked with a set  
4 time parameter on a conveyor are not reaching the proper  
5 temperature in the specified time because they are larger  
6 than the size for which the conveyor is calibrated. Buyer  
7 specifications are established to restrict the size of products  
8 received from the supplier.

9 **(3) Develop and Implement Recipe/Process Instructions**

10 Simple control measures integrated into recipes and processes can improve  
11 management control over foodborne illness risk factors. For example:

- 12 • Process instructions that specify using color-coded cutting boards  
13 for separating raw animal foods from ready-to-eat products are  
14 developed to control the potential for cross contamination.
- 15 • Pasteurized eggs are substituted in recipes that call for raw or  
16 undercooked eggs to reduce the risk of foodborne illness.
- 17 • Commercially precooked chicken is used in recipes calling for  
18 cooked chicken such as chicken salad to reduce the risk of  
19 contaminating food-contact surfaces and ready-to-eat food with  
20 raw chicken.
- 21 • Pasta is chilled in an ice bath immediately after cooking and  
22 before apportioning into single servings. This is specified in  
23 the procedures for cooking spaghetti.

1                   **(4) Establish First-In-First-Out (FIFO) Procedures**

2                   Product rotation is important for both quality and safety reasons. “First-In-First-  
3                   Out” (FIFO) means that the first batch of product prepared and placed in  
4                   storage should be the first one sold or used. Date marking foods as  
5                   required by the Food Code facilitates the use of a FIFO procedure in  
6                   refrigerated, ready-to-eat, potentially hazardous foods (TCS foods). The FIFO  
7                   concept limits the potential for pathogen growth, encourages product rotation,  
8                   and documents compliance with time/temperature requirements.

9                   **(5) Develop and Implement Standard Operating Procedures**  
10                   **(SOPs)**

11                   Following standardized, written procedures for performing various tasks  
12                   ensures that quality, efficiency, and safety criteria are met each time the  
13                   task is performed. Although every operation is unique, the following list  
14                   contains some common management areas that can be controlled with  
15                   SOPs:

- 16                   • Personnel (disease control, cleanliness, training)
- 17                   • Facility maintenance
- 18                   • Sanitary conditions (general cleaning schedule, chemical storage,  
19                   pest control, sanitization of food-contact surfaces)
- 20                   • Sanitary facilities (approved water supply and testing, if applicable,  
21                   scheduled in-house inspection of plumbing, sewage disposal,  
22                   handwashing and toilet facilities, trash removal)
- 23                   • Equipment and utensil maintenance.

24                   SOPs can also be developed to detail procedures for  
25                   controlling foodborne illness risk factors:

- 26                   • Procedures are implemented for measuring temperatures at a  
27                   given frequency and for taking appropriate corrective actions to  
28                   prevent hazards associated inadequate cooking.
- 29                   • Adequate handwashing is achieved by following written procedures  
30                   that dictate frequency, proper technique, and monitoring.

31                   **(6) Develop and Implement Risk Control Plans (RCPs)**

1 An RCP is a concisely written management plan developed by the retail or  
2 food service operator with input from inspectors that describes a  
3 management system for controlling specific out-of-control foodborne illness risk  
4 factors. An RCP is intended to be a voluntary strategy that inspectors and  
5 the person in charge jointly develop to promote long-term compliance for  
6 *specific* out-of-control foodborne illness risk factors. For example, if food is  
7 improperly cooled in the establishment, a system of monitoring and record  
8 keeping outlined in an RCP can ensure that new procedures are  
9 established to adequately cool the food in the future. An RCP should require  
10 that the basic control systems in the plan be implemented for a designated  
11 period of time (e.g., 60 – 90 days) and allow inspector oversight. The longer  
12 the plan is implemented, the more likely it is that the new controls will  
13 become “habits” that continue to be used in the food establishment after  
14 inspector oversight ends.

15 An RCP should stress simple control measures that can be integrated into the  
16 daily routine. It should be brief, no more than one page for each risk  
17 factor, and address the following points in very specific terms:

- 18 • What is the risk factor to be controlled?
- 19 • How is the risk factor controlled?
- 20 • Who is responsible for the control?
- 21 • What monitoring and record keeping is required?
- 22 • Who is responsible for monitoring and completing records?
- 23 • What corrective actions should be taken when deviations are  
24 noted?
- 25 • How long is the plan to continue?
- 26 • How are the results of the RCP communicated to inspectors?

27 By implementing an RCP, the retail or food service operator will have the  
28 opportunity to determine the appropriate corrective action for the identified  
29 problem and design an implementation strategy to best suit the establishment  
30 and operation. Since the RCP is tailored to meet the needs of the food  
31 establishment, the operator takes complete ownership of the plan and is

1 ultimately responsible for its development and implementation. The role of  
2 inspectors is to consult with the operator by suggesting ways that the risk  
3 factor(s) might be controlled.

4 By creating an RCP, the operator realizes that a problem exists in the  
5 established food safety management system and commits to a specific  
6 correction plan rather than merely acknowledging a single violation. Follow up  
7 by telephone or in person indicates to the operator that inspectors are  
8 interested in seeing the plan succeed. This also gives inspectors an  
9 opportunity to answer any questions and offer feedback to the operator to  
10 make the RCP more useful. An example of an RCP, along with a blank  
11 template that can be used by regulatory jurisdictions, is found in FDA's  
12 Regulator's Manual: <http://www.cfsan.fda.gov/~dms/hret3toc.html>.

### 13 (7) **Develop and Implement Comprehensive Voluntary Food Safety** 14 **Management Systems based on HACCP Principles**

15 The *Food Code* only requires HACCP plans for a few specialized processes;  
16 however, the development of voluntary HACCP plans is always encouraged.  
17 FDA Operator's Manual, "*Managing Food Safety: A Manual for the Voluntary*  
18 *Use of HACCP Principles for Operators of Food Service and Retail*  
19 *Establishments*" is written to aid food establishment managers in the  
20 development of food safety management systems based on HACCP  
21 principles. A retail or food service operator, in consultation with an  
22 appropriate regulatory authority or other food safety professional, can use  
23 this document to establish an effective food safety management system to  
24 control for all foodborne illness risk factors. This document is available from  
25 FDA through the following website: <http://www.cfsan.fda.gov/~dms/hret2toc.html>.

## 26 27 **6. INSPECTION FORM AND SCORING**

### 28 **A. The Inspection Form**

29 The inspection form is the official document utilized by a regulatory  
30 agency for documentation of compliance of the food establishment with  
31 regulatory requirements. The goal of the inspection form is to clearly,

1 concisely, and fairly present the compliance status of the food establishment  
2 and to convey compliance information to the permit holder or person in charge  
3 at the conclusion of the inspection.

4 The inspection report should be kept in the food establishment's files for  
5 subsequent compliance actions and review before the next inspection.  
6 Individual inspection reports are to be made available for public review in  
7 accordance with Freedom of Information criteria.

8 Annex 7 of the Model Food Code provides an inspection form that may be  
9 completed for routine, follow-up, and compliance inspections. This inspection  
10 form meets requirements established in Standards 3 and 6 of the Program  
11 Standards.

## 12 **B. Debiting Methodology**

13 If a violation exists during an inspection, it should always be marked on the  
14 inspection report, even if corrected on site. Violations existing at the time  
15 of the inspection probably would have persisted if it were not for the  
16 inspection. Slight violations, such as one dirty utensil among hundreds of  
17 clean utensils, do not indicate that the food establishment is significantly  
18 deviating from the Code requirements; therefore, discretion in marking is  
19 required.

20 It is very important to investigate the root causes of violations and mark them  
21 appropriately. Without taking this extra step, inspectors will merely point out  
22 violations and will not identify weaknesses in the management system in  
23 place. If long-term control of the behaviors or practices leading to the  
24 violations is expected, inspectors must identify the causes.

## 25 **C. Scoring**

26 Regulatory agencies may use scoring methods to rate food establishments.  
27 Depending on the system used, establishment scoring may provide an  
28 indication of how well a food establishment is complying with the food  
29 safety rules of the regulatory agency.

30 Some agencies use a system of compliance tools as provided in Chapter 8  
31 and Annex 1 of the Model Food Code to protect public health. The inspection

1 score may serve as the basis for triggering follow-up inspections or other  
2 forms of regulatory sanctions when they fall too far from the accepted  
3 levels. In addition, scoring may provide a mechanism for consumers to make  
4 informed choices regarding where they want to eat.

5 Use of scoring systems also has negative consequences. For example, it  
6 is possible for a food establishment to receive a high numerical or letter  
7 score while exhibiting some very serious deficiencies. In recognition of this  
8 drawback, some jurisdictions forego scoring systems in favor of demerits or  
9 debit systems without assigning a final score. This focuses attention on the  
10 items needing correction. Compliance and enforcement decisions can still be  
11 based on the increasing levels of identified deficiencies. Whatever method or  
12 system of establishment rating is used, policies regarding follow-up and  
13 enforcement actions should be established in writing, linked to the rating  
14 system, and administered consistently.

## 15 **7. CLOSING CONFERENCE**

16 The closing conference should include a detailed discussion of the food  
17 establishment's plans for correcting violations found during the inspection. The  
18 evidence collected or observed during the inspection and the alternatives  
19 available for compliance should be emphasized. On-site corrections made  
20 during the inspection should be acknowledged on the inspection report and  
21 in the closing conference.

22 The compliance plan should address changes in procedures that will prevent  
23 the recurrence of noted violations. The food establishment's compliance plans  
24 should be formally documented on the inspection report form. Follow-up  
25 letters may be necessary to elicit fulfillment of these agreements. It is  
26 important to stress to the operator that long-term correction of violations  
27 related to foodborne illness risk factors and Food Code interventions is far  
28 more important than corrections of non-critical items.

## 29 **8. SUMMARY**

1           Although a retail and food service operator has the responsibility for  
2           establishing a food safety management system for controlling foodborne illness  
3           risk factors, inspectors have a vital, multi-faceted role in consumer protection. It  
4           is essential that inspectors are provided with the proper training,  
5           equipment, time, and resources to adequately perform their jobs.  
6           The primary role of inspectors is to ensure that the operator has effective  
7           control of foodborne illness risk factors. Once inspectors have established a  
8           dialogue with the person in charge and employees, conducted a  
9           menu/food list review, and established a dialogue with the person in charge,  
10          inspectors will have enough information to mentally place menu items into  
11          one of the three process flows. The inspection can then focus on  
12          assessing the operator's active managerial control of foodborne illness risk  
13          factors associated with each process.  
14          Once out-of-control foodborne illness risk factors are identified, the role of  
15          inspectors shifts to assisting the operator with strengthening the existing food  
16          safety management system through intervention strategies designed to achieve  
17          immediate and long-term compliance. With inspector's assistance, a retail and  
18          food service operator can achieve long-term behavioral change resulting in a  
19          reduction in risk factor occurrence and an increase in public health  
20          protection.

1 **Guam Annex**

2 **4 Food Processing Criteria**

3 **1. INTRODUCTION**

4 **2. REDUCED OXYGEN PACKAGING**

5 **3. SMOKING AND CURING**

6  
7 **1. INTRODUCTION**

8 From its inception, the retail segment of the food industry has prepared foods in  
9 consumer-sized portions, using commercially available equipment for cutting,  
10 grinding, slicing, cooking, and refrigeration, and applying herbs and spices readily  
11 available to consumers at their local grocery.

12 Over the past score of years, retail segment operators have expanded into food  
13 manufacturing/processing-type operations, often using sophisticated new  
14 technologies and equipment that are sometimes microprocessor-controlled. Many  
15 now desire to alter the atmospheres within food packages, or apply federally  
16 regulated chemical food additives as a method of food preservation. Food  
17 processing operations now being conducted or proposed include cook-chill; vacuum  
18 packaging; sous vide; smoking and curing; brewing, processing, and bottling  
19 alcoholic beverages, carbonated beverages, or drinking water; and custom  
20 processing of animals.

21 The Guam Food Code specifies that a HACCP plan acceptable to the regulatory  
22 authority be the basis for approving food manufacturing/processing operations at  
23 retail. The HACCP plans are to be provided and accepted in two ways as follows.

24 **(A) Reduced Oxygen Packaging**

25 Section 3-502.12 of the Guam Food Code provides the criteria that are to be met in  
26 the HACCP plans of those operators who are conducting reduced oxygen  
27 packaging (ROP) operations. Unless prior approval of the HACCP plan is required  
28 by the regulatory authority, the HACCP plan covering this operation along with the  
29 related records documenting monitoring and corrective actions need only be

1 available and acceptable to the regulatory authority at the time of inspection.

2 **(B) Other Food Manufacturing/Processing Operations**

3 Except for ROP as discussed in (A) above, the Food Code specifies under §§ 3-  
4 502.11, 8-103.10, 8-103.11, and 8-201.13 that the food establishment operator  
5 must obtain a variance from the regulatory authority for all food  
6 manufacturing/processing operations based on the prior approval of a HACCP plan.  
7 The purpose of this Annex is to provide processing criteria for different types of  
8 food manufacturing/processing operations for use by those preparing and reviewing  
9 HACCP plans and proposals. Criteria for additional processes will be provided as  
10 they are developed, reviewed, and accepted.

11  
12 **2. REDUCED OXYGEN PACKAGING**

13 **(A) Introduction**

14 ROP which provides an environment that contains little or no oxygen, offers  
15 unique advantages and opportunities for the food industry but also raises many  
16 microbiological concerns. Products packaged using ROP may be produced safely  
17 if proper controls are in effect. Producing and distributing these products with a  
18 HACCP approach offer an effective, rational, and systematic method for the  
19 assurance of food safety. The purpose of this Annex is to provide guidelines for  
20 effective food safety controls for retail food establishments covering the receipt,  
21 processing, packaging, holding, displaying, and labeling of food in reduced oxygen  
22 packages.

23 **(B) Definitions**

24 The term ROP is defined as any packaging procedure that results in a reduced  
25 oxygen level in a sealed package. The term is often used because it is an  
26 inclusive term and can include other packaging options such as:

- 27 (1) *Cook-chill* is a process that uses a plastic bag filled with hot  
28 cooked food from which air has been expelled and which is  
29 closed with a plastic or metal crimp.
- 30 (2) *Controlled Atmosphere Packaging (CAP)* is an active system which

1 continuously maintains the desired atmosphere within a package  
2 throughout the shelf-life of a product by the use of agents to bind or  
3 scavenge oxygen or a sachet containing compounds to emit a gas.  
4 CAP is defined as packaging of a product in a modified atmosphere  
5 followed by maintaining subsequent control of that atmosphere.

6 (3) *Modified Atmosphere Packaging (MAP)* is a process that employs a  
7 gas flushing and sealing process or reduction of oxygen through  
8 respiration of vegetables or microbial action. MAP is defined as  
9 packaging of a product in an atmosphere which has had a one-time  
10 modification of gaseous composition so that it is different from that of  
11 air, which normally contains 78.08% nitrogen, 20.96% oxygen, 0.03%  
12 carbon dioxide.

13 (4) *Sous Vide* is a specialized process of ROP for partially cooked  
14 ingredients alone or combined with raw foods that require  
15 refrigeration or frozen storage until the package is thoroughly  
16 heated immediately before service. The sous vide process is a  
17 pasteurization step that reduces bacterial load but is not sufficient  
18 to make the food shelf-stable. The process involves the following  
19 steps:

- 20 (a) Preparation of the raw materials (this step may include  
21 partial cooking of some or all ingredients);
- 22 (b) Packaging of the product, application of vacuum, and  
23 sealing of the package;
- 24 (c) Pasteurization of the product for a specified and  
25 monitored time/temperature;
- 26 (d) Rapid and monitored cooling of the product at or below  
27 3°C (38°F) or frozen; and
- 28 (e) Reheating of the packages to a specified temperature  
29 before opening and service.

30 (5) *Vacuum Packaging* reduces the amount of air from a package and

1 hermetically seals the package so that a near-perfect vacuum  
2 remains inside. A common variation of the process is Vacuum Skin  
3 Packaging (VSP). A highly flexible plastic barrier is used by this  
4 technology that allows the package to mold itself to the contours of  
5 the food being packaged.

6 **(C) Benefits of ROP**

7 ROP can create a significantly anaerobic environment that prevents the growth of  
8 aerobic spoilage organisms, which generally are Gram-negative bacteria such as  
9 pseudomonads or aerobic yeast and molds. These organisms are responsible for  
10 off-odors, slime, and texture changes, which are signs of spoilage.

11 ROP can be used to prevent degradation or oxidative processes in food products.  
12 Reducing the oxygen in and around a food retards the amount of oxidative rancidity  
13 in fats and oils. ROP also prevents color deterioration in raw meats caused by  
14 oxygen. An additional effect of sealing food in ROP is the reduction of product  
15 shrinkage by preventing water loss.

16 These benefits of ROP allow an extended shelf life for foods in the distribution  
17 chain, providing additional time to reach new geographic markets or longer display  
18 at retail. Providing an extended shelf life for ready-to-eat convenience foods and  
19 advertising foods as “Fresh – Never Frozen” are examples of economic and  
20 quality advantages.

21 **(D) Safety Concerns**

22 Use of ROP with some foods can markedly increase safety concerns. Unless  
23 potentially hazardous foods (time/temperature control for safety foods) are  
24 protected inherently, simply placing them in ROP without regard to microbial  
25 growth will increase the risk of foodborne illnesses. ROP processors and  
26 regulators must assume that during distribution of foods or while foods are held by  
27 retailers or consumers, refrigerated temperatures may not be consistently  
28 maintained. In fact, a serious concern is that the increased use of vacuum  
29 packaging at retail supermarket deli-type operations may be followed by  
30 temperature abuse in the establishment or by the consumer. Consequently, at

1 least one barrier or multiple hurdles resulting in a barrier need to be incorporated  
2 into the production process for products packaged using ROP. The incorporation of  
3 several sub-inhibitory barriers, none of which could individually inhibit microbial  
4 growth but which in combination provide a full barrier to growth, is necessary to  
5 ensure food safety.

6 Some products in ROP contain no preservatives and frequently do not possess  
7 any intrinsic inhibitory barriers (such as, pH,  $a_w$ , or salt concentrations) that either  
8 alone or in combination will inhibit microbial growth. Thus, product safety is not  
9 provided by natural or formulated characteristics.

10 An anaerobic environment, usually created by ROP, provides the potential for  
11 growth of several important pathogens. Some of these are psychotropic and grow  
12 slowly at temperatures near the freezing point of foods. Additionally, the inhibition  
13 of the spoilage bacteria is significant because without these competing organisms,  
14 tell-tale signs signaling that the product is no longer fit for consumption will not  
15 occur.

16 The use of one form of ROP, vacuum packaging, is not new. Many food products  
17 have a long and safe history of being vacuum packaged in ROP. However, the  
18 early use of vacuum packaging for smoked fish had disastrous results, causing a  
19 long-standing moratorium on certain uses of this technology.

20 (1) *Refrigerated Holding Requirements for Foods in ROP*

21 Safe use of ROP technology demands that adequate refrigeration be maintained  
22 during the entire shelf-life of potentially hazardous foods (time/temperature control  
23 for safety foods) to ensure product safety.

24 Bacteria, with the exception of those that can form spores, are eliminated by  
25 pasteurization. However, pathogens may survive in the final product if  
26 pasteurization is inadequate, poor quality raw materials or poor handling practices  
27 are used, or post-processing contamination occurs. Even if foods that are in ROP  
28 receive adequate thermal processing, a particular concern is present at retail when  
29 employees open manufactured products and repackage them. This operation  
30 presents the potential for post-processing contamination by pathogens.

1 If products in ROP are subjected to mild temperature abuse, i.e., 5°-12°C (41°-53°F),  
2 at any stage during storage or distribution, foodborne pathogens, including **Bacillus**  
3 **cereus**, **Salmonella** spp., **Staphylococcus aureus**, and **Vibrio**  
4 **parahaemolyticus**, can grow slowly. Marginal refrigeration that does not facilitate  
5 growth may still allow **Salmonella** spp., **Campylobacter** spp., and **Brucella** spp. to  
6 survive for long periods of time.

7 Published surveys indicate that refrigeration practices at retail need improvement.  
8 Some refrigerated products offered in convenience stores were found at or above  
9 7.2°C (45°F) 50% of the time; in several cases temperatures as high as 10°C (50°F)  
10 were observed. Delicatessen display cases have been shown to demonstrate poor  
11 temperature control. Foods have been observed above 10°C (50°F) and above  
12 12.8°C (55°F) in several instances. Supermarket fresh meat cases appear to have  
13 a relatively good record of temperature control. However, even these foods can  
14 occasionally be found above 10°C (50°F).

15 Temperature abuse is common throughout distribution and retail markets. Strict  
16 adherence to temperature control and shelf-life must be observed and documented  
17 by the establishment using ROP. Information on temperature control should also be  
18 provided to the consumer. Currently these controls are not extensively used.  
19 Additionally, some commercial equipment is incapable of maintaining foods below  
20 7.2°C (45°F) because of refrigeration capacity, insufficient refrigerating medium,  
21 or poor maintenance.

22 Most warehouses and transport vehicles in U.S. distribution chains maintain  
23 temperatures in the 0°-3.3°C (32°-38°F) range. It must be assumed, however, for  
24 purposes of assessing risk, that occasionally temperatures of 10°C (50°F) or higher  
25 may occur for extended periods. At retail, further temperature abuse must also be  
26 assumed. For instance, retail display cases can be as high as 13.3°C (56°F) for  
27 short periods and some refrigerated foods are provided no refrigeration for short  
28 periods of time. These realities point to the need for establishments to implement  
29 controls, such as buyer specifications, over refrigerated distribution systems so that  
30 better temperature control can be ensured.

1 (2) Control of ***Clostridium botulinum*** and ***Listeria monocytogenes*** in  
2 Reduced Oxygen Packaged Foods

3 There has been an increased interest in vacuum packaging or MAP at retail using  
4 conventional refrigeration for holding. Refrigerated foods packaged at retail may be  
5 chilled either after they are physically prepared and repackaged, or packaged after  
6 a cooking step. In either case but primarily the latter, germination of ***Clostridium***  
7 ***botulinum*** is the causative agent of botulism, a severe food poisoning  
8 characterized by double vision, paralysis, and occasionally death. Sanitary  
9 safeguards must be employed to prevent reintroduction of pathogens. Chief among  
10 these is ***Listeria monocytogenes***.

11 ***Clostridium botulinum*** is the causative agent of botulism, a severe food  
12 poisoning characterized by double vision, paralysis, and occasionally death. The  
13 organism is an anaerobic spore-forming bacteria that produces a potent  
14 neurotoxin. The spores are ubiquitous in nature, relatively heat-resistant, and can  
15 survive most minimal heat treatments that destroy vegetative cells. Certain strains  
16 of ***C. botulinum*** (type E and non-proteolytic types B and F), which have been  
17 primarily associated with fish, are psychotropic and can grow and produce toxin at  
18 temperatures as low as 3.3°C (38°F). Other strains of ***C. botulinum*** (type A and  
19 proteolytic types B and F) can grow and produce toxin at temperatures slightly  
20 above 10°C (50°F). If present, ***C. botulinum*** could potentially grow and render  
21 toxigenic a food packaged and held in ROP because most other competing  
22 organisms are inhibited by ROP. Therefore, the food could be toxic yet appear  
23 organoleptically acceptable. This is particularly true of psychotropic strains of  
24 ***C. botulinum*** that do not produce tell-tale proteolytic enzymes. Because botulism  
25 is potentially deadly, foods held in anaerobic conditions merit regulatory concern  
26 and vigilance.

27 The potential for botulism toxin to develop also exists when ROP is used after  
28 heat treatments such as pasteurization, or sous vide, processing of foods which  
29 will not destroy the spores of ***C. botulinum***. Mild heat treatments in combination  
30 with ROP may actually select for ***C. botulinum*** by killing off its competitors. If the

1 applied heat treatment does not produce commercial sterility, the food requires  
2 refrigeration to prevent spoilage and ensure product safety. For this reason, sous  
3 vide products are frequently flash frozen in liquid nitrogen and held in frozen  
4 storage until use.

5 There is a further microbial concern with ROP at retail. Processed products such  
6 as meats and cheeses which have undergone an adequate cooking step to kill  
7 ***L. monocytogenes*** can be contaminated when opened, sliced, and repackaged at  
8 retail. Thus, a simple packaging or repackaging operation can present an  
9 opportunity for recontamination with pathogens if strict sanitary safeguards are  
10 not in place.

11 Processors of products using ROP should be cautious if they plan to rely on  
12 refrigeration as the sole barrier that ensures product safety. This approach  
13 requires very rigorous temperature controls and monitored refrigeration  
14 equipment. If extended shelf life is sought, a temperature of 3.3°C (38°F) or  
15 lower must be maintained at all times to prevent outgrowth of ***C. botulinum*** and the  
16 subsequent production of toxin. ***Listeria monocytogenes*** can grow at even lower  
17 temperatures; consequently, appropriate use-by dates must be established and  
18 readily apparent to the consumer. Since refrigeration alone does not guarantee  
19 safety from pathogenic microorganisms, additional growth barriers must be  
20 provided. Growth barriers are provided by hurdles such as low pH,  $a_w$ , or short  
21 shelf life, and constant monitoring of the temperature. Any one hurdle, or a  
22 combination of several, may be used with refrigeration to control pathogenic  
23 outgrowth.

24 (3) *Design of Heat Processes for Foods in Reduced Oxygen Packages*

25 Heat processes for sous vide or cook-chill operations should be designed so that,  
26 at a minimum, all vegetative pathogens are destroyed by a pasteurization process.  
27 Special labeling of these products is necessary to ensure adequate warning to  
28 consumers that these foods must be refrigerated at 5°C (41°F) and consumed by  
29 the date required by the Code for that particular product.

30 The National Advisory Committee on Microbiological Criteria for Foods (NACMCF),

1 chartered by the U.S. Department of Agriculture (USDA) and the Department of  
2 Health and Human Services (DHHS), commented on the microbial safety of  
3 refrigerated foods containing cooked, uncured meat or poultry products that are  
4 packaged for extended refrigerated shelf life and are ready-to-eat or prepared with  
5 little or no additional heat treatment. The NACMCF recommended guidelines for  
6 evaluating the ability of thermal processes to inactivate ***L. monocytogenes*** in  
7 extended shelf life refrigerated foods. Specifically, it recommended a proposed  
8 requirement for demonstrating that an ROP process provides a heat treatment  
9 sufficient to achieve a 4 decimal log reduction (4D) of ***L. monocytogenes***.

10 Other scientific reports recommend more extensive thermal processing. Thermal  
11 processes for sous vide practiced in Europe are designed to achieve a 12-13 log  
12 reduction (12-13D) of the target organism ***Streptococcus faecalis***. It is reasoned  
13 that thermal inactivation of this organism would ensure destruction of all other  
14 vegetative pathogens.

15 Food manufacturers with adequate in-house research and development programs  
16 may have the ability to design their own thermal processes. However, small  
17 retailers and supermarkets may not be able to perform the microbiological  
18 challenge studies necessary to provide the same level of food safety. If a retail  
19 establishment wishes to use an ROP process, microbiological studies should be  
20 performed by, or in conjunction with, an appropriate process authority or person  
21 knowledgeable in food microbiology who is acceptable to the regulatory authority.  
22 Finally, if foods are held long enough, even under proper refrigeration, extended  
23 shelf life may be a problem. A study on fresh vegetables inoculated with  
24 ***L. monocytogenes***, conducted to determine the effect of CAP on shelf life, found  
25 that CAP lengthened the time that all vegetables were considered acceptable, but  
26 that populations of ***L. monocytogenes*** increased during that extended storage.

27 (4) *Consumer Handling Practices and In-Home Refrigerator*  
28 *Temperatures*

29 Extended shelf life provided by ROP is cause for concern because of the potential  
30 for abuse by the consumer. Consumers often cannot, or do not, maintain adequate

1 refrigeration of potentially hazardous foods (time/temperature control for safety  
2 foods) at home. Foods in ROP that are taken home might not be eaten until  
3 enough time/temperature abuse has occurred to allow any pathogens present to  
4 increase to levels which can increase the chance of illness. Under the best of  
5 circumstances, home refrigerators can be expected to range between 5° and 10°C  
6 (41°-50°F). One study reported that home refrigerator temperatures in 21% of the  
7 households surveyed were 10°C (50°F). Another study reported more than 1 of 4  
8 home refrigerators are above 7.2°C (45°F) and almost 1 of 10 are above 10°C  
9 (50°F). Thus, refrigeration alone cannot be relied on for ensuring microbiological  
10 safety after foods in ROP leave the establishment.

11 Consumers have come to expect that certain packages of foods would be safe  
12 without refrigeration. Low-acid canned foods have been thermally processed,  
13 which

14 renders the food shelf-stable. Retort heating ensures the destruction of **C.**  
15 **botulinum** spores as well as all other foodborne pathogens. Yet consumers may  
16 not understand that most products that are packaged in ROP are not commercially  
17 sterile or shelf-stable and must be refrigerated. A clear label statement to keep  
18 the product refrigerated must be provided to consumers.

19 The use of ROP has been extensively studied by regulators and the food industry  
20 over the past several years. Recommendations have been adapted from the  
21 Association of Food and Drug Officials “Retail Guidelines - Refrigerated Foods in  
22 Reduced Oxygen Packages” and New York State Department of Agriculture and  
23 Markets “Proposed Reduced Oxygen Packaging Regulations.” As provided in the  
24 Food Code, some ROP operations may be conducted under provision 3-502.12  
25 Reduced Oxygen Packaging, Criteria. Food that is packaged by an ROP method  
26 under these provisions is considered safe while it is under the control of the  
27 establishment and, if the labeling instructions are followed, while under the  
28 control of the consumer.

29 **(E) Safety Barrier Verification**

30 The safety barriers for all processed foods held in ROP at retail must be verified in

1 writing. This can be accomplished through written certification from the product  
2 manufacturer. Independent laboratory analysis using methodology approved by  
3 the regulatory authority can also be used to verify incoming product and should be  
4 used to verify the barriers in a product that is packaged within the establishment  
5 by an ROP method. It should be noted that the Association of Food and Drug  
6 Officials (AFDO) guidelines recommend that laboratory analysis be conducted by  
7 official methods of the AOAC International (AOAC).

8 The multiple barrier or hurdle efficacy should be validated by inoculated pack or  
9 challenge studies. A product should be tested under abuse temperatures to  
10 demonstrate product safety during the food's shelf life.

11 Any changes in product formulation or processing procedures are cause for  
12 notification of the regulatory authority and a required approval of the revised ROP  
13 process. A record of all safety barrier verifications should be updated every 12  
14 months. This record must be available to the regulatory authority for review at the  
15 time of inspection.

16 ***(F) USDA Process Exemption***

17 Meat and poultry products cured at a food processing plant regulated by the U.S.  
18 Department of Agriculture using substances specified in 9 CFR 424, Preparation  
19 and Processing Operations, are exempt from the safety barrier verification  
20 requirements. Other ROP operations may be developed that do not meet the  
21 provisions of Section 3-502.12 of the Code and that will require a variance and  
22 prior approval by the regulatory authority under Section 3-502.11.

23 ***(G) Recommendations for ROP Without Multiple Barriers***

24 (1) *Employee Training*

25 If ROP is used, employees assigned to packaging of the foods must have  
26 documented proof that demonstrates familiarity with ROP guidelines in this Annex  
27 and the potential hazards associated with these foods. At the discretion of the  
28 regulatory authority, a description of the training and course content provided to  
29 the employees must either be available for review or have prior approval by the  
30 regulatory authority.

1                   (2)     *Refrigeration Requirements*

2           Foods in ROP that have only one barrier, i.e., refrigeration, to **C. botulinum**, must  
3           be refrigerated to 5°C (41°F) or below and marked with a use-by date within either  
4           the manufacturer's labeled use-by date or 14 days after preparation at retail,  
5           whichever comes first. Alternatively, foods packaged by ROP may be kept frozen if  
6           freezing is used as the declared primary safety barrier. Any extension of shelf life  
7           past 14 days will require a further variance that considers lower refrigeration  
8           temperatures. Foods that are intended for refrigerated storage beyond 14 days  
9           must be maintained at or below 3°C (38°F).

10                   (3)     *Labeling - Refrigeration Statements*

11           All foods in ROP which rely on refrigeration as a barrier to microbial growth must  
12           bear the statement “Important - Must be kept refrigerated at 5°C (41°F)” or  
13           “Important - Must be kept frozen,” in the case of foods which rely on freezing as a  
14           primary safety barrier. The statement must appear on the principal display panel in  
15           bold type on a contrasting background. Foods held under ROP which have lower  
16           refrigeration requirements as a condition of safe shelf life must be monitored for  
17           temperature history and must not be offered for retail sale if the temperature and  
18           time specified in the variance are exceeded.

19                   (4)     *Labeling - “Use-by date”*

20           Each container of food in ROP must bear a “use-by” date. This date cannot exceed  
21           14 days from retail packaging or repackaging without a further variance granted by  
22           the regulatory authority. The date assigned by a repacker cannot extend beyond  
23           the manufacturer's recommended “pull date” for the food. The “use-by” date must  
24           be listed on the principal display panel in bold type on a contrasting background.  
25           Any label must contain a combination of a “sell-by” date and use-by instructions  
26           which makes it clear that the product must be consumed within 14 days of retail  
27           packaging or repackaging, as an acceptable alternative to a 14 day “use-by” date,  
28           i.e., for product packaged on November 1, 1999 - “Sell by November 10, 1999” -  
29           use within 4 days of sell-by date. Foods that are frozen before or immediately  
30           after packaging and remain frozen until use should bear a “Keep frozen, use within

1 4 days after thawing” statement.

2 **(H) Foods Which Require a Variance Under Code Section 3-502.11 if**  
3 **Packaged in Reduced Oxygen Atmosphere**

4 (1) Processed fish and smoked fish may not be packed by ROP unless  
5 establishments are approved for the activity and inspected by the  
6 regulatory authority. Establishments packaging such fish products,  
7 and smoking and packing establishments, must be licensed in  
8 accordance with applicable law. Caviar may be packed on the  
9 premises by ROP if the establishment is approved by the regulatory  
10 authority and has an approved scheduled process established by a  
11 processing authority acceptable to the regulatory authority.

12 (2) Soft cheeses such as ricotta, cottage cheese, cheese spreads, and  
13 combinations of cheese and other ingredients such as vegetables,  
14 meat, or fish at retail must be approved for ROP and inspected by the  
15 regulatory authority.

16 (3) Meat or poultry products which are smoked or cured at retail, except  
17 that raw food of animal origin which is cured in a USDA-regulated  
18 processing plant, or establishment approved by the regulatory  
19 authority to cure these foods may be smoked in accordance with  
20 approved time/temperature requirements and packaged in ROP at  
21 retail if approved by the regulatory authority.

22 **(I) Hazard Analysis and Critical Control Point (HACCP) Operation**

23 All food establishments packaging food in a reduced oxygen atmosphere must  
24 develop a HACCP plan and maintain the plan at the processing site for review by  
25 the regulatory authority. For ROP operations the plan must include:

26 (1) A complete description of the processing, packaging, and storage  
27 procedures designated as critical control points, with attendant  
28 critical limits, corrective action plans, monitoring and  
29 verification schemes, and records required;

30 (2) A list of equipment and food-contact packaging supplies used,

1 including compliance standards required by the regulatory authority,  
2 i.e., USDA or a recognized third party equipment by the evaluation  
3 organization such as NSF International;

4 (3) A description of the lot identification system acceptable to the  
5 regulatory authority;

6 (4) A description of the employee training program acceptable to the  
7 regulatory authority;

8 (5) A listing and proportion of food-grade gasses used; and

9 (6) A standard operating procedure for method and frequency of cleaning  
10 and sanitizing food-contact surfaces in the designated processing  
11 area.

12 **(J) Precautions Against Contamination at Retail**

13 Only unopened packages of food products obtained from sources that comply  
14 with the applicable laws relating to food safety can be used to package at retail  
15 in a reduced oxygen atmosphere. If it is necessary to stop packaging for a period  
16 in excess of one-half hour, the remainder of that product must be diverted for  
17 another use in the retail establishment.

18 **(K) Disposition of Expired Product at Retail**

19 Processed reduced oxygen foods that exceed the “use-by” date or manufacturer's  
20 “pull date” cannot be sold in any form and must be disposed of in a proper manner.

21 **(L) Dedicated Area/Restricted Access**

22 All aspects of reduced oxygen packaging shall be conducted in an area  
23 specifically designated for this purpose. There shall be an effective separation to  
24 prevent cross contamination between raw and cooked foods. Access to processing  
25 equipment shall be restricted to responsible trained personnel who are familiar  
26 with the potential hazards inherent in food packaged by an ROP method. Some  
27 ROP procedures such as sous vide may require a “sanitary zone” or dedicated  
28 room with restricted access to prevent contamination.

11 **3. SMOKING AND CURING**

12 **(A) Introduction**

13 Meat and poultry are cured by the addition of salt alone or in combination with one  
14 or more ingredients such as sodium nitrite, sugar, curing accelerators, and  
15 spices. These are used for partial preservation, flavoring, color enhancement,  
16 tenderizing and improving yield of meat. The process may include dry curing,  
17 immersion curing, direct addition, or injection of the curing ingredients. Curing  
18 mixtures are typically composed of salt (sodium chloride), sodium nitrite, and  
19 seasonings. The preparation of curing mixtures must be carefully controlled. A  
20 number of proprietary mixtures which are uniform in composition are available. The  
21 maximum residual sodium nitrite in the finished product is limited to 200 ppm by  
22 the USDA Food Safety and Inspection Service (FSIS). A sodium nitrite  
23 concentration of 120 ppm is usually sufficient for most purposes. Specific  
24 requirements for added nitrite may be found in USDA regulations, 9 CFR 424. It is  
25 important to use curing methods which achieve uniform distribution of the curing  
26 mixture in the meat or poultry product.

27 **(B) Definitions**

28 Cured meat and poultry can be divided into three basic categories: (1)  
29 uncomminuted smoked products; (2) sausages; and (3) uncomminuted unsmoked  
30 processed meats.

1 (1) *Uncomminuted smoked products* - include bacon, beef jerky, hams,  
2 pork shoulders, turkey breasts, turkey drumsticks.

3 (2) *Sausages* - include both finely ground and coarse ground  
4 products.

5 Finely ground sausages include bologna, frankfurters, luncheon  
6 meats and loaves, sandwich spreads, and viennas. Coarse ground  
7 sausages include chorizos, kielbasa, pepperoni, salami, and  
8 summer sausages.

9 (3) *Cured sausages* - may be categorized as: (1) raw, cured; (2)  
10 cooked, smoked; (3) cooked, unsmoked; and (4) dry, semidry, or  
11 fermented.

12 (4) *Uncomminuted, unsmoked processed products* - include corned  
13 beef, pastrami, pig's feet, corned tongues. This category of  
14 products may be sold as either raw ready-to-cook or ready-to-  
15 eat.

16 **(C) *Incorporation of Cure Ingredients***

17 Regardless of preparation method, cure ingredients must be distributed  
18 throughout the product. Cure ingredients may be introduced into sausage  
19 products during mixing or comminuting. Proper and thorough mixing is necessary  
20 whether the cure is added to the formulation in dry or solution form. Muscle  
21 cuts may be cured by immersion into a curing (pickle) solution. These methods  
22 depend on slow diffusion of the curing agents through the product. Products  
23 must be properly refrigerated during immersion curing.

24 Several methods may be used to shorten curing times. These include hot  
25 immersion curing greater than 49°C (>120°F), injection by arterial pumping (e.g.,  
26 hams), and stitch pumping by a series of hollow needles. If the injection method  
27 is used, injection needles must be frequently monitored during processing to  
28 ensure that they are not fouled or plugged.

29 Tumbling or massaging may also be used as an aid to hasten curing. Proper  
30 sanitation must be observed to prevent contamination during this operation.

1 The dry curing method, a similar process, may also be used. In this case, curing  
2 ingredients are rubbed over cuts and surfaces of meat held under refrigeration.  
3 Precautions must include wearing sanitary gloves when meat is handled. Product  
4 temperature maintenance is critical.

5 **(D) Smoking**

6 Smoking is the process of exposing meat products to wood smoke. Depending  
7 on the method, some products may be cooked and smoked simultaneously, smoked  
8 and dried without cooking, or cooked without smoking. Smoke may be produced by  
9 burning wood chips or using an approved liquid smoke preparation. Liquid smoke  
10 preparations may also be substituted for smoke by addition directly onto the product  
11 during formulation in lieu of using a smokehouse or another type of smoking  
12 vessel. As with curing operations, a standard operating procedure must be  
13 established to prevent contamination during the smoking process.

14 **(E) Fermentation and Dehydration**

15 Meat may be fermented or dehydrated for preservation. The purpose of  
16 fermentation is to reduce the pH to below 4.6 and inhibit bacteria harmful to  
17 health as well as bacteria which can cause spoilage. Meat products may also  
18 be cured and then dehydrated to prevent germination and growth of bacterial  
19 spores. Many fermented and dehydrated meats are made without a cooking  
20 step. Sanitary practices in the production of these products are extremely  
21 important because ***Staphylococcus aureus*** can be introduced. ***Staphylococcus***  
22 ***aureus*** produces an enterotoxin that is heat stable and thus will not be  
23 inactivated by subsequent cooking.

24 Processed pork products require treatment to destroy ***Trichinella spiralis***. At  
25 retail, products which contain raw pork and which are not subsequently cooked  
26 must be produced from certified trichina-free pork or treated to destroy  
27 trichinae. USDA regulations, 9 CFR 318.10(c)(3), establish various  
28 requirements for destroying trichina in pork by heating, freezing, drying, or  
29 smoking.

1 Some fermented and dry cured products are processed without cooking. The  
2 labeling for these products should include instructions to the consumer to cook  
3 thoroughly before consumption.

4 **(F) Recommendations for Safe Curing of Meat and Poultry**

5 (1) *Posting of Acceptable Products*

6 A list of products approved by the regulatory authority, or by an approved  
7 knowledgeable authority on curing acceptable to the regulatory authority, must  
8 be posted in the processing area of the establishment.

9 (2) *Employee Training*

10 Employees assigned to cure meat or poultry must demonstrate familiarity with  
11 these guidelines and the potential hazards associated with curing foods. A  
12 description of the training and course content provided to the employees must  
13 be available for review by the regulatory authority.

14 (3) *HACCP*

15 A HACCP plan is needed for all curing operations. The following  
16 recommendations must be met to cure meat and poultry products in the  
17 establishment. References are available from local USDA extension offices,  
18 public libraries, and college or university food or meat science departments to  
19 develop HACCP plans for curing meat and poultry.

20 (a) *Critical Control Points*

21 The following are critical control points to be addressed:

- 22 (i) Purchase of prepared cure mixes; or
- 23 (ii) If cure mixes are blended on the premises instead of  
24 acquired pre-mixed, mixing must be carefully controlled by  
25 using calibrated weighing devices.
- 26 (iii) Cure ingredients must be stored in a dry location. Cure must  
27 be discarded if the package is wet or appears to have been  
28 wetted.

29 (b) *Raw Material Handling*

- 1 (i) Thawing must be monitored and controlled to ensure  
2 thoroughness and to prevent temperature abuse.  
3 Improperly thawed meat could cause insufficient cure  
4 penetration. Temperature abuse can cause spoilage or  
5 growth of pathogens.
- 6 (ii) Meat must be fresh. Curing may not be used to salvage  
7 meat that has excessive bacterial growth or spoilage.
- 8 (c) Formulating, Preparation and Curing
- 9 (i) A formulation and preparation procedure must be  
10 documented.
- 11 (ii) All equipment and utensils must be cleaned and sanitized.
- 12 (iii) Pieces must be prepared to uniform sizes to ensure uniform  
13 cure penetration. This is extremely critical for dry and  
14 immersion curing.
- 15 (iv) Calibrated scales must be used to weigh ingredients.
- 16 (v) A schedule or recipe must be established for determining  
17 the exact amount of curing formulation to be used for a  
18 specified weight of meat or meat mixture.
- 19 (vi) Methods and procedures must be strictly controlled to ensure  
20 uniform cure.
- 21 (vii) Mixing of curing formulation with comminuted Ingredients  
22 must be controlled and monitored.
- 23 (viii) All surfaces of meat must be rotated and rubbed at intervals  
24 of sufficient frequency to ensure cure penetration when a dry  
25 curing method is used.
- 26 (ix) Immersion curing requires periodic mixing of the batch to  
27 facilitate uniform curing.
- 28 (x) The application of salt during dry curing of muscle cuts  
29 requires that the temperature of the product be strictly  
30 controlled between 1.7°C (35°F) and 7.2°C (45°F). The lower

1 temperature is set to limit microbial growth and the upper  
2 temperature is set for the purpose of ensuring cure  
3 penetration. Refer to USDA regulations 9 CFR  
4 318.10(c)(3)(iv) for specific details on dry curing.

5 (xi) Curing solutions must be discarded daily unless they remain  
6 with the same batch of product during its entire curing  
7 process.

8 (xii) Injection needles must be inspected for plugging when stitch  
9 pumping or artery pumping of muscle cuts is performed.

10 (xiii) Sanitary casings must be provided for sausage, chub or loaf  
11 forming.

12 (xiv) Casings may not be stripped for reuse in forming additional  
13 chubs or sausages from batch to batch.

14 (xv) Hot curing of bacon bellies, hams, or any other products  
15 must be performed at >49°C (120°F) as specified in 9 CFR  
16 318.

17 (d) *Cooking and/or Smoking*

18 (i) When smokehouses are initially installed or structurally  
19 modified, calibration of product heating characteristics must  
20 be ascertained by competent food technologists. Tests  
21 should be run with full range of anticipated product loading.  
22 Verification of even airflow and moisture should be  
23 recorded in operational records of the smokehouse for these  
24 various loads.

25 (ii) Procedures for delivering the appropriate thermal treatment of  
26 cooked meats in conformance with the *Food Code* must be  
27 developed and used. (Also see 9 CFR 318.17 and 318.23 for  
28 USDA requirements for meat products.) A minimum of  
29 73.9°C (165°F) should be used for cured poultry products.

30 (iii) Cooking equipment that provides even temperature control

- 1 of the heating medium must be used.
- 2 (iv) Products must be adequately separated to prevent overlap in  
3 the cooking media whether immersed in hot water, sprayed  
4 with hot water, steamed, or oven heated.
- 5 (v) Calibrated temperature measuring devices must be used for  
6 determining internal product temperatures.
- 7 (vi) Temperature measuring device probes must be sanitized to  
8 prevent contaminating products when internal temperatures  
9 are measured.
- 10 (vii) Calibrated temperature measuring devices must be used for  
11 measuring temperatures of the heating medium.
- 12 (viii) Raw products must be separated from cooked products.
- 13 (ix) Time/temperature parameters of the cooking process must be  
14 monitored and recorded. In some processes, the heating  
15 medium temperature should also monitored.
- 16 (e) *Cooling*
- 17 (i) Cooling must be done in accordance with recommendations  
18 in the *Food Code* or under a variance. The USDA Cooling  
19 Guideline, FSIS Directive 7110.3 for special procedures for  
20 cured products, provides specific guidance.
- 21 (ii) Written cooling procedures must be established.
- 22 (iii) Chill water used in water sprays or immersion chilling which  
23 is in direct contact with products in casings or products  
24 cooked in an impervious package must be properly  
25 chlorinated.
- 26 (iv) Chill water temperature must be monitored and controlled.
- 27 (v) Chill water may not be reused until properly chlorinated.  
28 Reclaimed chill water must be discarded daily.
- 29 (vi) Product must be placed in a manner that allows chilled  
30 water or air to uniformly contact the product for assurance

- 1 of uniform cooling.
- 2 (vii) Internal temperatures must be monitored during cooling by  
3 using calibrated temperature measuring devices.
- 4 (viii) Adequate cooling medium circulation must be maintained and  
5 monitored.
- 6 (ix) Temperatures of the cooling medium must be monitored and  
7 recorded in accordance with a written procedure.
- 8 (x) Handling of product must be minimized during cooling,  
9 peeling of casing, and packaging. Sanitary gloves must be  
10 used in these procedures.
- 11 (f) *Fermentation and Drying*
- 12 (i) Temperature and time must be controlled and logs must be  
13 maintained that record the monitoring of this process.
- 14 (ii) Humidity must be controlled by use of a humidistat.  
15 Monitoring of the process must be recorded in a written log.
- 16 (iii) Product must be kept separated to allow adequate air  
17 circulation during the process.
- 18 (iv) Use of an active and pure culture must be ensured to effect  
19 a rapid pH drop of the product. Use of commercially  
20 produced culture is necessary and the culture must be used  
21 according to the manufacturer's instructions.
- 22 (v) Determination of the pH of fermented sausages at the end  
23 of the fermentation cycle must be recorded.
- 24 (vi) Handling of products must be minimized and only done with  
25 sanitary gloves or sanitized utensils.
- 26 (vii) Dry (unfermented) products may not be hot smoked until the  
27 curing and drying procedures are completed.
- 28 (viii) Semi-dry fermented sausage must be heated after  
29 fermentation to a time/temperature sufficient to control  
30 growth of pathogenic and spoilage organisms of concern.

1                   (4)    *Dedicated Area/Restricted Access*

2           All aspects of curing operations must be conducted in an area specifically  
3           designated for this purpose. There must be an effective separation to prevent  
4           cross contamination between raw and cooked foods or cured and uncured foods.  
5           Access to processing equipment shall be restricted to responsible trained  
6           personnel who are familiar with the potential hazards inherent in curing foods.

7                   (5)    Equipment Cleaning and Sanitizing

8           The procedures for cleaning and sanitization must be accomplished according  
9           to parts 4-6 and 4-7 of the Guam Food Code.

**Risk factors** are improper practices or procedures identified as the most prevalent contributing factors of foodborne illness or injury. Public Health interventions are control measures to prevent foodborne illness or injury.

**GOOD RETAIL PRACTICES**

Good Retail Practices are preventive measures to control the introduction of pathogens, chemicals, and physical objects into food.

Mark "X" in box if numbered item is not in compliance. Mark "X" in appropriate box for COS, R, and PTS. COS= Corrected on-site during inspection R= Repeat violation PTS= Demerit points
